THE colossal relief of a wounded lion guarding the flag of the French kings, which is embroidered with fleurs-de-lis, at Lucerne, is one of the most remarkable of memorials. It is a tribute by their countrymen to the Swiss guard slain in defending the Tuileries on August 10, 1792. It was a happy thought of THORWALDSEN to propose that the relief could be carved on the face of a rocky surface. He prepared the model, and the work was carried out by a Swiss sculptor, LUCAS AHORNE. Of late years the lion has shown signs of decay. This is owing to the trickling of water through the rock. Several experts were asked to propose a remedy. They consider that the figure and its background must be completely isolated from the main body of the sandstone cliff, and that an extensive draining and drying of the rocky surroundings must also be carried out, so that the progressive decay of the monument may be reduced to a minimum. These works are already in progress.

THERE is an Historic Monuments Commission, which has its headquarters in Paris, and looks after the old buildings in the city as well as those elsewhere in France. In addition is a special society having for mission the care of antique remains in Paris. There are also, we believe, district archæological societies in the capital. The Prefect of the Seine does not consider they are sufficient, and he has established a new body that will be known as "La Commission du Vieux Paris." The members consist of architects, painters, men of letters and archæologists. It will be their duty to seek after vestiges of old Paris; to report on the condition of the remains, to watch over their conservation, to follow daily any excavations which may be undertaken or any transformations which are indispensable. Happily, explorations will only be intermittent, for it could hardly be expected that a dramatist like M. SARDOU, an administrator like M. JULES CLARETIE, a painter like M. DÉTAILLE and a manufacturer like M. FROMENT-MEURICE would be able to devote themselves to archæology.

A CONTRACTOR has more chance of success in a Scottish court when a case is brought against him under the Employers' Liability Act than in England. We have from time to time noticed cases which in the South would be decided for the plaintiff, but in the North have gone against him. The latest example was heard before Sheriff GUTHRIE in Glasgow and the judge dismissed it as irrelevant. The plaintiff claimed 250*l*. damages for injuries sustained through a fall from a ladder having one rung in a defective condition. Sheriff GUTHRIE held that as a ladder is a very ordinary piece of plant, the plaintiff could have discovered the defects by ordinary inspection. If so, why did he not see the defective rung himself, and either complain or avoid using it? He was using the ladder more than any other person. His lordship said he was not quite sure that a fall from the ladder was the necessary or natural result of a rung breaking, unless plaintiff was coming down in a careless way. A careful man has two hands and another foot with which to cling to the ladder. The plaintiff was ordered to pay costs. The result is according to common sense, but in an English court there seems to be a belief that a working man is like a baby, and must be protected as if he had no power over himself.

IN recording the death of the late Mr. J. L. PEARSON, R.A., the *Antiquary* says:—Mr. PEARSON was in his eighty-first year, and had been brought up in the old school of ecclesiastical "restorers," who considered that if you pulled down an old building and erected a copy of it you were preserving the old work. Mr. PEARSON seemed unable to shake off this exploded and destructive conception of what true restoration means. Hence he was brought of late years into constant conflict with antiquaries, more especially in regard to matters relating to Westminster Hall, and the Abbey Church, Peterborough, Rochester, Chichester Cathedrals, and other Mediaeval buildings. No one disputed Mr. PEARSON's great skill as a designer of new churches. What was disputed was his treatment of ancient ones. Perhaps Mr. PEARSON's interest in antiquities may be gauged to some extent by the fact that, although living in London and elected a Fellow of the Society of Antiquaries on June 16, 1853, he never attended a meeting of the Society, and was never formally admitted to his Fellowship in it.

THE Disney Professorship of Archæology in the University of Cambridge is vacant, five years having elapsed since the last election. The electors, who are the Vice-Chancellor and the heads of colleges or their *locum tenentes*, will meet on Saturday, January 15, 1898, at 12 noon, to elect a person to fill the office. The professor must be a member of the University of Cambridge and of the degree of M.A. or of some higher degree in the same. He is required to deliver six lectures at least in the course of each academical year, at such days and hours as the Vice-Chancellor shall appoint. The professorship is tenable for five years, and the professor may be re-elected. Mr. RIDGEWAY, whose term of office has expired, seeks re-election. Candidates are requested to send their names to the Vice-Chancellor on or before January 8.

A CURIOUS question has been raised, says the *American Architect*, by a bequest to Brown University, which provides that the whole amount, some 40,000 dols., shall be expended in the erection of a stone gateway to the University grounds. As Brown University is 'by no means' rich, and would be very glad of a fund of 40,000 dols., the income of which would aid materially in extending its range of instruction, the restriction of the bequest to the erection of a useless and pompous entrance to the modest grounds of the college is rather annoying, although, of course, the University officials are not wanting in gratitude for the intended favour. In some cases, however, gifts of the sort are encumbered with conditions which make it necessary to refuse them altogether, and it would be advantageous, both to intending benefactors of such institutions and to the beneficiaries, to have the subject of public bequests better understood. Everyone remembers the fund established by legacy for the benefit of indigent Hebrews in a city where no Hebrews lived; and the income of many charitable funds is now disproportioned to the objects to which it is specifically restricted. In London legislative action has been invoked to permit the diversion to other purposes of the income of funds left to support charities now obsolete or unnecessary; and colleges, hospitals and orphanages might perhaps with advantage present to the public occasional statements which would show the importance of bequeathing money to their general maintenance fund rather than to restricted objects, which, as in the case of the Brown gateway, add nothing to the efficiency of the institution, even if the sum received is sufficient, without additions from other sources, to carry out its intended purpose, which is not always the case.

SARACENIC ARCHITECTURE.*

THE influences of Saracenic art were felt wherever the Moslem religion prevailed, whether it was in India, Persia, Egypt, Asia Minor, Africa, Spain or the Holy Land, and for a time it seemed destined to become the prevailing style of architecture and the Mohammedan faith the universal literature. But for the courage and skill of the justly renowned Charles Martel, Moslem power and Moslem religion might have reigned as supreme in Europe as it has in Asia and the north of Africa. The defeats which the Moslems experienced in their battles with Charles Martel were the most severe reverses with which they had met, and from them may be dated the beginning of the decline of their power in western Europe. All Europe was aroused and the Crusades or Holy Wars raged with fury until the Moslem power was crippled if not destroyed.

"The art of the Arabs," says Lamartine, "is like a bright dream. It is a caprice of genius worked in rich work of stone, in delicate filigrees, in light fringes, in flowing lines, in lace-work, amid all of which the eye loses itself in pursuit of a symmetrical form which it is about to grasp, when the fair illusion changes into other beautiful combinations of forms, escapes and is dispelled." The various forms to be found in this species of architecture look like a strong vegetation—a vegetation luxuriant and also fantastic. Arab art is not nature; it is a dream of nature." Still, if the Arabs rioted in fanciful decorations they at the same time were careful to construct their edifices on the simplest and most natural plan.

In dimension and colours almost all their mosques are alike. Umbrageous courts of trees, refreshed by fountains surrounded by porticoes, stand in front of these sanctuaries, which form halls, square or round, surmounted by cupolas. At the four corners rise beautiful minarets. The interiors are simple in structure, all the ornaments consisting of arabesques painted upon the wall and of calligraphic inscriptions taken from the Koran. Lamps, ostrich eggs and bouquets of flowers hang in great numbers from the wires that stretch from one pillar to another across the interior. The flags of the floor are concealed by rich carpets. "The effect," says Lamartine, "is simple and impressive. It is not a temple in which a god dwells; it is a house of prayer and contemplation where men assemble to adore the one immortal God."

One of the most ancient and celebrated religious edifices of the Arabs is the mosque raised by Omar in Jerusalem, within the wall of Solomon's temple, and exactly upon the rock where they say Jehovah spake to Jacob. It is called El-Sakhra in memory of that event, and is octagonal in shape, each side being decorated with seven arcades of pointed arches. A second range of arcades, narrower and inclined inwards, supports a beautiful dome of copper, formerly gilt. The walls are covered with squares of blue enamel, and the gates ornamented with beautiful columns lead into the sanctuary which is covered with white marble. Visitors walk upon a rich and many-coloured pavement between two circular ranges of pillars composed of grey marble taken from Bethlehem and the Holy Sepulchre.

In the seventeenth century Mr. P. Rogers counted in the mosque no less than 7,000 chandeliers carved in copper or in iron gilt. All around the mosque branch off twelve porticoes placed at the same distance the one from the other, and irregular like the cloisters of the Alhambra. They are composed of three or four arcades and sometimes these arcades support a second range. This noticeable edifice was founded in the seventh century and was embellished by the caliphs Abd-el-Malek and El-Lanid. After the Crusades it was converted into a church by the Christians, but some hundred years later Saladin gave it back to Mohammed.

In early times Moslem art extended into Africa. Cairo, a town entirely Arabic, contains very ancient and very rich mosques, that of Ebn-Touloun especially being deserving of attention. It dates from the ninth century. Ahmed-Ben-Touloun, the founder of a brief dynasty, who caused it to be constructed and gave it its name, wished its porticoes to be sustained by 300 columns, but the architect was unable to construct such a great number. The mosque is built of brick, and stucco is used to conceal this material. The sanctuary is circular and its dimensions are very limited, the court and the porticoes actually constituting the mosque. The enclosing wall is pierced with nine gates. Around the court above the porticoes runs a high and beautiful frieze which crowns a highly ornamented cornice.

We must not quit Cairo without noticing the valley of the caliphs, as the religious art of the Arabs shows itself alike in their temples and their tombs. In this valley of the caliphs Mussulman dynasties repose in a marvellous necropolis at the foot of Mount Mokattam. Touloun and Biburs, Saladin and Malek-Abdul rest in a palace in which oriental architecture has abandoned itself to the most delightful caprices. It is quite a Gothic town with an air of extraordinary grace and of

devotion without gloom. The mosques are mingled with the tombs, and the minarets, symbolical of hope, rise from the midst of funeral cupolas. Space will not permit us to give a description of the tombs and mosques of the valley of the caliphs.

Nowhere have the Arabs left greater proof of their architectural genius than in Spain, where their civilisation flourished for seven centuries. The Alhambra, which is perhaps one of their greatest architectural marvels, must occur at once to the mind of the student of Moslem art. Specially worthy of admiration is the Court of Lions belonging to this edifice, a quadrangle 98 feet long by 65 feet wide. This court is surrounded by a peristyle of light columns ornamented on two sides by advanced porticoes like the bold portals of some Gothic churches, and is carved with wonderful accuracy, skill and elegance.

In the presence of innumerable vistas of courts and chambers, fantastic decorations of structures resembling the tents of the desert, terminating in conical vaults, the spectator stands immovable and mute, and thinks himself transported to the entrance of one of those fairy palaces of which we read in Arabian tales.

"Airy galleries," says Chateaubriand, "canals constructed of white marble, and bordered by citrons and flowering orange trees, fountains and solitary courts, present themselves on all sides before the eyes of the traveller, and across the long vaults of the porticoes he perceives other labyrinths and new enchantments. The beautiful azure of the heavens reveals itself between the columns that sustain a chain of Moorish arches. The walls covered with arabesques seem to the view like those cloths of the East which are embroidered in the leisure of the harem by the industrious hands of the female slave. Everything luxurious, religious, warlike, seems to breathe in this magnificent edifice. It is a sort of bower of love in a mysterious retreat in which the Moorish kings enjoyed all the pleasures and forgot all the cares of life."

The decoration of the Alhambra consists of varnished tiles of all colours—yellow, red, black, green and white—forming mosaics which cover the walls with a kind of carpet-work in flowers, knots, zigzags, and inscriptions sculptured in low relief upon the stucco and plaster. Nothing, for instance, could be more charming than the walls of the Hall of the Ambassadors, inscribed with verses of the Koran and stanzas of poetry in the Arabic calligraphy, while the ceiling of cedar wood—a marvel of carpentry—presents an actual problem of geometric forms.

If we except a number of columns, some flags, vases, basins, and little niches for placing Turkish slippers, there is not perhaps a single piece of marble employed in the interior decorations of the Alhambra. The same fact is to be observed respecting all the Arabic monuments of Cordova, Segovia, Seville, Valladolid and Toledo. Stucco and plaster were found to suffice for all the Moorish ornamentations.

The splendid and famous mosque of Cordova is composed of nineteen colonnades or porticoes in horseshoe arcades. In front of the façade is a court surrounded with galleries, commenced in 786. This edifice, which was as dear to the Arabs of Spain as Sta Sophia was to the Byzantines, and St. Peter's to the early Christians, was restored and enriched at different times. It received extensions and additions as late as the tenth century. Its height is not extraordinary, being only 30 feet from its base to the woodwork of the roof, but its horizontal dimensions are colossal. The mosque, properly so-called, is 400 feet long by 366 feet broad. Isolated columns to the number of 646 support the arcade, exclusive of the engaged columns, or those that form the three porticoes of the court. Formerly they were much more numerous, before the mutilations which the building has from time to time suffered took place.

Exquisite is the characteristic of all Arab conceptions; while the walls of the old towns of the north of Spain are heavy and coarsely built, like the defences improvised by people in extremities, the Moorish fortifications are light, graceful and constructed with true artistic skill. For instance, the towers of the walls of Seville, embellished with brick lines, courses of white stone and Arabic inscriptions, were so carefully built and with materials so well chosen that their edges and ridges are still as sharp as when first constructed. The length of the walls is about six miles. Of their fifteen gates the most have been reconstructed and modified, but the well-known "Gate of Cordova" among others has preserved its high square fortress. In the neighbourhood of this gate there is an aqueduct of 400 arches, eighteen miles in length, which shows that the Arabs were equal to the Romans in this form of construction.

It is in Spain that Mussulman art has displayed such bold and original invention. In the East it was often inspired by Byzantine models; and it is not astonishing that Sta Sophia, that queen of mosques, should often serve as a model for many of the smaller sanctuaries of Constantinople.

As we have seen, Sassanian architecture may have had some influence upon Moslem architecture. The Mosque of Achmet was entirely vaulted in semi-domes, which supported a

* From a paper by Mr. Cyrus K. Porter, published in *Stone*.

central cupola. In front of it was a court surrounded by a quadruple portico supporting columns with black and white capitals and with bases of bronze. The style of its architecture recalls the best epochs of Arabic art, although it was built in the seventeenth century. A gate of bronze gives access to the interior of the mosque. Says Gautier:—"What struck us first were the four enormous pillars, or rather fluted towers, which bear the weight of the principal cupola. Fifteen men, it is said, could not embrace them. These pillars, with capitals carved in stalactites, were surrounded at middle height by a plain band covered with inscriptions in Turkish character. They wore an air of robust majesty and indestructible power."

We have carefully traced the development of Saracen or Moslem architecture through its various stages, and have found in it much that is really beautiful and much that is to be admired. It has not to any great extent been adopted in America, nor is it suitable for our northern climate, especially for winter use. For summer hotels nothing could surpass it for elegance and comfort, and it is well adapted for our more southern states. The Hôtel Ponce de Leon, of St. Augustine, Florida, is an adaptation of that style for the purposes of a sea-side hotel.

OLD MONASTERIES AT CARDIFF.

A SERIES of excavations have been carried out for some time past in Cooper's Fields and in the grounds between Cathays Park and Queen Street by Mr. C. B. Fowler, architect, on behalf of Lord Bute, with the view of finding all possible traces of the ancient monasteries of the Black and the Greyfriars. The result of the investigations and operations carried out is that the sites have been discovered, plans of restoration on the old lines have been made, archaeological and antiquarian lore has been considerably enriched, and Lord Bute has had the foundations of the old walls of both places, long buried in the earth, brought up overground. In connection with the work that has been accomplished Mr. C. B. Fowler delivered a lecture in the Engineers' Institute, under the auspices of the Cardiff Naturalists' Society, on "Excavations of the Black and Greyfriars' Monasteries, Cardiff Castle."

In the course of his remarks Mr. Fowler said the monastery of the Blackfriars, Dominican Order, was situated near the east bank of the river Taff, without the meskin, or west gate, in the grounds of Cardiff Castle, and founded in 1256 by Richard de Clare, Earl of Gloucester and Lord of Glamorgan, son of Henry I. and Lady West, daughter of Prince Rhys ap Tewdwr, Dinwair Castle, ruler of West Wales from the Neath river to Cardigan Bay. The chief founder was the father of Gilbert de Clare, founder of the Greyfriars, and the monastery was probably dedicated to St. Dominic in 1216. The dissolution of the monasteries was the means of casting the brethren on the world without allowance, except that they received 40s. and a new gown. The Blackfriars monastery was no doubt approached by a bridge over the river Taff, about 100 yards higher up than the present one leading to Canton, and the foundations of it may now be seen at low water. The arms of the Order were a shield with cross, the motto being "Laudare Benedicere Prædicare," which means to praise, to bless, to preach. Several old graves were found inside the site of the old church, but only one contained a coffin and this one was in the choir. No doubt here rest the remains of Bishop Ecclescliffe, who was a Bishop of Llandaff for nearly twenty-three years, who died in 1346 and was buried in this church. Lord Bute, said the lecturer, intends having a memorial slab fixed over the grave with the following inscription cut thereon in Latin:—"Here lies the most illustrious and most reverend father and brother in Christ, John de Ecclescliffe, of the order of preachers of the diocese of Durham, Master of Theology at Oxford, who long dwelt with his brethren at London; Privy Councillor of Edward II., King of England; consecrated Bishop of Glasgow in the year of our Lord 1318; translated to Bethlehem in 1319, to Connor in 1322 and to Llandaff 1323. He died at Llandaff on January 2, 1346, and was buried here amongst his brethren, on whose soul may God have mercy. Amen." Sepulchral slabs, fragments of encaustic tiles of the fourteenth century, painted glass, several keys, a leaden bull of Pope Innocent IV., &c., were found among the débris. In his opinion the tiles were manufactured between 1320 and 1360. They are about 5 inches square and represent three subjects, namely, armorial, pictorial and symbolical. There are the arms of England and France, of Maltravers, Mansell, Craddock, Charlton, St. George and De Clare, together with doves, lions, fleur-de-lis, &c. Many such specimens he found in Gloucester Cathedral, the old vicarage of St. Mary, Bristol, and other places, including Abergavenny, Bath and St. David's Cathedral. There were also found some stone mouldings, door and window jambs, mullions, labels, window coping, a holy water stoup, a part of a piscina, arch moulds and several fragments of worked tomb canopies. The whole of the stone pitching was found intact all over the area examined, and so also was a piece of the

original altar slab. The habit of dress of the Order who occupied this monastery consisted of a tunic, leather belt, long scapular hanging down in front and back, also a capuce, or shoulder piece, and over this was placed a black cloak and black capuce. Indoors the dress was of white, but for outdoor wear the black cloak and capuce were put on. That was the full costume. To those who loved to revel amongst the remains of past ages, dry bones, old glass, floor tiles and sepulchral slabs, &c., broken and piled in heaps and surveyed not merely as broken fragments, but as living people, and which represented the feelings of which they at one time formed a part, one could almost imagine he heard the ringing of the dormitory bell at midnight and saw the little community rise from their couches, each hand making the sign of the cross and every lip moving in silent prayer, the forms clothed in white gliding down the steps wending their way to the choir, led by rushlight bearers and chanting in slow Gregorian tones those solemn old airs which reverberated weirdly from choir to nave, from nave to aisles in the dimly-lit building or by the soul-inspiring light of the moon; the sick, who generally occupied the dormitory above the sacristy, rising from their beds peering through the squints which gave them a view of the high altar and allowed of the sweet redolence of the incense pervading their sanctum; how when the service was finished the worshippers returned to their dormitory, getting to Mass again in the early morning next day, and later on in the cloisters of the grassy "garth" thinking in silence of their responsibilities and how best to discharge them. Having described the daily routine of the fathers from early Mass till the vespers, the lecturer said the preaching friars used to go about two and two preaching at village crosses, fairs, festivals, wakes, &c., and in all the parish churches when requested to do so by the rectors. In their own churches there was a short sermon daily, and a longer one on special occasions, such as festivals and during Lent.

The monastery of Greyfriars at Cardiff was founded by Gilbert de Clare, son of Robert de Clare, first Earl of Gloucester, the founder of the Blackfriars, and he died in 1147. The church was dedicated to St. Francis, and was under the wardenship of the Bristol House. It was situated without the eastern gate, but the exact position of the monastery and church were unknown by modern folks until the recent investigations and discoveries were made. The ruins of the Herbert mansion remain, that place having been at one time inhabited by Sir William Herbert. It was built about the year 1585, and was called "The Friars," and it was pulled down towards the end of the last century by the present Lord Bute's grandfather. The church was about 180 feet in length by 62 feet in width, and consisted of nave, north and south aisles and a large chancel about 30 feet wide. Many skeletons, over thirty in number, had been unearthed inside the walls of the church. Several coins of the reign of Edward and an abbey token were also found during the excavations, as well as a number of arch moulds, capitals, &c. In 1538 the Greyfriars surrendered to the king's visitor, the priors signing the surrender being Thomas Gwyn (guardian), Roland Jones, Owen Jones, Robert Castell, Richard Mellyn, Hugh Sawyer, John Brown, William Barber and Garwain Jones. They gave up the place to the bailey's deputy, John Loveday, and the visitor appropriated the most valuable articles there. Owen Glendower was very fond of the Greyfriars, or Franciscans, and refrained from destroying their convent in Crockherbtown when he sacked Cardiff, but he seized their valuables, which they had lodged in the castle for safety. Sir William Fleming and Llewellyn Bren were in charge of the Greyfriars Monastery, the former being high sheriff of Glamorgan in 1316, and the latter resided at Castle Coch, but held Caerphilly Castle, in a military sense, for the Earl de Clare. According to one writer, Sir Hugh de le Spenser, who was hated by all the barons of Great Britain, came to Glamorgan, dismissed Llewellyn Bren, and placed a Norman in his place. Llewellyn Bren took the field and 20,000 Welshmen gathered under the banner of Glamorgan, which he unfurled. They knocked Norman castles in all parts of the country to pieces, and the Normans bolted to England. Edward II. sent an envoy to Glamorgan and summoned Llewellyn Bren to the presence of the king in London, giving him a guarantee of safety. He went, and after stating his story to His Majesty in person, received a full pardon. He then returned to Cardiff with the king's pardon in his possession. He was, however, apprehended by Sir William Fleming, and hanged in a building which stood between the present Royal Arcade and Great Frederick Street. When the news of the tragedy reached King Edward he signed the death warrant of Sir William Fleming, who was hanged on the same spot on which Llewellyn Bren was executed. Sir William had caused the body of Llewellyn Bren to be buried in the Greyfriars Church, and he himself was buried in the same grave by the side of Bren. This grave had been found and opened a few weeks ago, and the remains of the two bodies were discovered lying side by side. It was, he said, surprising so little was known regarding this monastery.

The lecture was splendidly illustrated by means of lantern views thrown on a screen by Mr. John Storrie, these comprising specimens of fourteenth-century painted glass and encaustic tiles, graves and vaults, coins, plans, mouldings, keys, Papal bulls, monks' habits, sepulchral slabs, maps and sites, &c., and proved a most interesting one.

At the close Bishop Hedley in a few words proposed a vote of thanks to the lecturer, remarking that in Mr. Fowler's discoveries and restorations they had a thing unique in the history of ecclesiastical communities and buildings.

Canon Thompson seconded, and the vote was most heartily passed.

Votes of thanks to Mr. Storrie and the chairman brought the proceedings to an end.

ADMINISTRATION OF THE BRITISH MUSEUM.

THE following evidence was given before the select committee on museums by Sir Edward Maunde Thompson, the principal librarian and secretary of the British Museum:—

Sir Henry Howarth: I should like to ask you a few questions on the two sides of the management of the Museum. First, with regard to the method of purchase which is carried out at the British Museum. Will you explain to the committee how purchases are made, by what process they are made, and who is eventually responsible for their being made?—In the first instance, objects that are offered are taken into consideration by the keeper of the particular department to which they refer. He reports upon them, if he is going to recommend them; if he thinks them worthy of purchase, he reports upon them. His report is sent in to the trustees' next meeting through me. I see the objects before they come before the trustees and form my own opinion, together with the opinion of the keeper of the department; we consult upon the purchase, and, if we are agreed, it goes before the trustees and is recommended. If the trustees approve the purchase, they sanction it.

Are the objects produced before the trustees?—Yes.

Now, in cases where it is impossible to produce the objects before the trustees; supposing there is something offered in Italy. Suppose you have a collection offered in Italy, or in Paris, which cannot be transferred to England, what, then, is the process of purchase?—We should never purchase a large collection without an officer of the department seeing it; of course, the purchase would depend upon his recommendation, but such a purchase so very seldom happens; in fact, I do not remember a recent case where we have bought a large collection. We have occasionally bought at foreign sales, sales in Paris for instance, and then we have to depend on the discretion of the keeper. The keeper goes over, if it is an important collection, and sees it. It is a rule that the keeper of the department sees everything he recommends.

That is a point I rather wished to draw attention to first; that is to say, we want to know the amount of initiative given to the different keepers. If an object is reported from Italy as being deserving of your purchase, what process is gone through at the Museum in order to acquire the object? You send your keeper out?—In the first place we should try to get the object sent to England, and, of course, if it is considered so important that the keeper should go, he will go to see it if we cannot get it sent to England; and in any case of any great sale the keeper would go over and see the objects before the sale came on. An exception may be made in sales of books which can be identified by catalogues.

How far would the Museum be committed to the purchase without the intervention of the trustees in such cases?—There is no committal at all. If the trustees give their sanction for bidding for the objects, of course the trustees are answerable; but in any case the keeper would have to report first of all before he bid.

Where you had cases where a purchase was to be made immediately or peremptorily, or the object would be lost, what initiative is given to you or to the keeper?—In that case it depends upon the value. The keeper of a department may spend up to 20*l.*; he can spend up to 100*l.* with my sanction; but beyond that he must get the sanction of two trustees in writing.

The sanction of two trustees in writing?—Yes, any he can catch between meetings. Of course, if a meeting is available, it is brought before the meeting, but in an emergency he would get the sanction of two trustees in writing—he writes to them or sees them.

Now when you say that a keeper has an option up to 20*l.*, does that mean that he can spend 20*l.* between two trustees' meetings, or that he can buy a number of objects, each of them under the value of 20*l.*?—No, it is only in the case of an emergency. Suppose, for instance, a man is passing through London and has a rare book which is worth 5*l.*, he may say, 'I cannot wait, I am on my way abroad, I will let you have it

for 5*l.*," the keeper then takes the responsibility and purchases it, and he reports it to the next meeting.

With regard to the intrinsic value of an object, or in regard to its genuineness, do you take the opinion of your keepers, or do you go outside the Museum for such information?—It is got from the keepers.

In every case?—In every case.

Do you ever call in officially referees of any kind, or experts?—No; the head of a department is the best expert, we consider, in his particular line. We should not go outside to ask an opinion.

And you consider that the head of every department in such a museum ought to be sufficiently an expert to be able to buy on his own judgment, and be made responsible on his own judgment?—Yes, certainly.

In your memory, has the recommendation of any of the keepers been reversed in certain cases on the ground either of the object not being genuine or of its intrinsic value not being sufficiently good?—There have been cases; they are rare, but they occasionally happen. For example, my opinion may go contrary to the opinion of the keeper; I may think a thing is too dear. I should then tell the trustees I thought it too dear, and they could either take my opinion or the opinion of the keeper.

Or as to the object being a desirable one for the collection?—Just so.

But with regard to its being a genuine object, which is a very important matter, and in regard to its being a falsification or forgery, do you rely on and make responsible the keeper of the department?—Yes, the keeper of the department would be responsible then.

Entirely?—Yes.

And you find that that has worked well?—Perfectly.

Now with regard to the keepers of the departments, how many departments do you have in the Museum?—In Bloomsbury?

Yes?—We have nine, including my department, which is mere administrative office.

Apart from administration?—There are eight.

Will you enumerate them?—The printed books department, the department of manuscripts, the department of oriental printed books and manuscripts, prints and drawings, Greek and Roman antiquities, Egyptian and Assyrian antiquities, ethnographical and British antiquities, and coins and medals.

And the keeper of each one of these departments has the initiative you mentioned just now?—Yes.

Now your annual grant for purchases—take last year. What would be the amount of that?—22,000*l.* for our Museum.

How is that apportioned between the different departments?—Well, first of all, the keepers send in their reports when we are making up the estimates, and from these we get a general idea of what their requirements are; then the sub-committee of finance goes into the whole question of the details of the figures, and they are adjusted in different directions; cut down, perhaps, where the trustees consider a department is asking too much, or raised if it has not got quite enough. Then the estimates go on to the Treasury, and then, generally, comes a struggle with the Treasury; they generally cut us down; negotiations go on, and, finally, we come to an arrangement. The departmental grants are generally in proportions; we know exactly the proportion each department requires.

Those proportions are more or less the same from year to year?—Well, yes; generally they run on. I must explain that at the present time the 22,000*l.* is to be made a fixed sum. Up to now we have always varied, but the Treasury has now given us 22,000*l.* for five years, and we are to be allowed to carry over to the next financial year anything we do not spend. Formerly savings went back to the Treasury.

Supposing you have a special pressure on one department during the year, and that there is a sale of coins comes off, or a sale of Greek vases, which requires exceptional expenditure, how do you meet that?—If we foresee that we make representation to the Treasury when the estimates are being framed? If it comes on suddenly afterwards, and a large sum is wanted, we go to the Treasury for a special grant.

It is also possible to transfer from one department to another department?—Oh, yes.

And to deal with the whole as a common fund in cases of emergency?—Yes. I should explain further with regard to the 22,000*l.* which is now being assigned to us as a fixed sum. The arrangement which the trustees have made at present is that they have granted the head of each department straight off three-fourths of what would be his normal figure, considering the rest of the money as a sort of reserve fund, so that in case of an emergency we have that to fall back upon for any department.

Now, there are eight of these heads of departments; how many are there in the next grade?—There is a certain number of assistant-keepers as well as keepers. We call keepers and assistant-keepers officers, and we have fourteen altogether

Then the next class are assistants. They are, of course, all educated men; and we have altogether sixty-six in the British Museum, including three in my office. I am not speaking of the Natural History Museum.

By those, you do not mean mere attendants, but men who pass a Civil Service examination?—Very highly qualified men.

With regard to the discipline of these men, are the keepers of the different departments responsible entirely for their staff and the work they do?—Yes, of course, under me; I have a general control, but you may say each keeper is responsible for his own staff.

Would you define it a little more closely. For instance, taking the cataloguing of objects, or the arrangement of particular rooms, or any particular work that has to be done by any particular man, is the choice entirely in the hands of the keeper of the department for the time being?—Well, generally it is within his department; but, of course, if there is an arrangement of the public galleries I should give my opinion as well. For instance, in arranging sculpture and so forth, the keeper of the department always consults me.

With regard to the selecting of men for the making of catalogues?—It is left to the keeper; he trains his staff and knows best.

These sixty men, you say, are all educated men?—Highly educated. Perhaps I should not say all. We have a certain number of older men who came in under the old *régime*, and they are not so highly qualified; but the men engaged now are all honours men of the universities.

In addition to being honours men of a university, do they pass a special examination before they come to you?—Yes, they pass our examination.

Will you tell us whether your examination prescribes special knowledge in special subjects, if a man is to have charge of a special department?—Our principle is this—to get the very best material to begin with, and we therefore get the highest educated men we can. We have them examined in, of course, a certain number of preliminary subjects which do not count for marks; but the real competition lies in four languages, Greek, Latin, French and German; those being the languages that every public school boy and university man is supposed to know, and the marks got for those languages count for the competition. But in addition to that, we test the men for the particular departments; for example, if a man goes into the Greek and Roman department he must know something about archaeology; he must in his university career have taken up the subject to some degree. We do not expect an expert, but a man who has a bent that way; so that in addition to his four languages he would have to pass in an archaeological paper. With coins, in the same way, he would have a numismatic paper. In prints and drawings he would have some elementary paper on art, and also we give him a few prints to see whether he has an eye. In the oriental department it is a little different; for instance, in the Egyptian and Assyrian department we let them off two languages, prescribing either Greek or Latin, and either French or German, but also a Semitic language; we do not care particularly what the Semitic language is, because such a language is the foundation for all that side. It is generally Hebrew. In the department of printed books and manuscripts we do the same thing. We have to get men according to the vacancy; we may want a Persian, Arabic or Hebrew scholar, but we now always make it a point that he must be well educated as well, and he must not only know that one subject.

Once having got him into this department that becomes his department, and you do not transfer him to any other department?—Yes.

Mr. Bartley: May I ask at what age he gets in?—About twenty-four, as fresh after getting his degree as possible.

Sir Henry Howorth: You say you do not transfer your men at all?—I will not say at all; very rarely we do when they are quite juniors; for example, the other day there was a man who had been beaten by another for the prints and drawings department, but he came in at the next examination and was put into the printed books. A vacancy occurred within a year in the prints and drawings, and we transferred him because he had special qualifications that way, and he was a first-rate man.

Your object, as a matter of fact, is to train specialists in these different departments?—Yes.

You think that is in every way the best way of administering?—Decidedly; we could not carry on the Museum if we kept shifting the men.

That extends to the library as well as to the departments of antiquities?—Everywhere; all departments alike.

In your opinion, does a man require a special training to become a librarian in a large library, in the same way as he does as keeper of an archaeological museum?—When he is brought in, do you mean?

After he is brought in?—Certainly.

Would you deem it a necessity, if he is to be a librarian in a large library, that he should know some other language besides his own?—Decidedly, as many languages as he can; we begin

with the four languages I have mentioned, but a man easily picks up others as he goes along.

Do you consider it an essential that any man who is an assistant in a library of this size should have a knowledge of some modern language or two?—Are you speaking of our library?

Your library first?—Most decidedly.

And the art library, which contains a very large proportion of German, French and Italian books?—Every man, I consider, when he comes in as a librarian, should certainly know French, Latin and German; if he knows Greek, so much the better.

Do you think it possible for a man to catalogue books, or make slips of books in foreign languages, unless he knows that language?—He could not make them to be worth anything.

And you think any system which prescribed that he should make such entries and make an inventory or catalogue is in effect an unworkable system in a big library?—Unless he knows the languages, it is quite impossible.

In regard to promotions in the department, are the men promoted as a matter of fact by seniority?—No.

Do you think it advisable that they should be promoted by seniority entirely?—No, certainly not; if you have a good man, certainly push him on. Of course you must take seniority into account to a certain extent. If you get two men equally good, the senior man goes up; but if you have A. and B., and if A. is a stupid man and B. a very brilliant fellow, and a hard-working man, and so on, we put him up naturally. We must think of the good of the place.

His efficiency is the first consideration?—Of course.

And that overrides entirely any claims of seniority?—Certainly; and particularly in promotions to the higher places—the officers' places.

Does the head of a department have anything to say to the promotion of men in his department?—Yes, it is all done on his recommendation, which I check.

But the head of the department really is responsible?—He is answerable originally for the recommendation of the promotion of his assistants.

With regard to the cataloguing, are your catalogues done by your own men?—Well, yes, I may say as a rule; there are sometimes some few catalogues made by outsiders. For example, in the department of oriental printed books and manuscripts, you get a collection perhaps of some out-of-the-way far Eastern language. It is not worth having a man in for that particular work, and we try and get a missionary, or some one who knows the language, and he makes the catalogue for us. For instance, at the present moment we have a Cingalese, who is cataloguing in some of these out-of-the-way oriental languages.

With that exception, and including the series of objects for which you have no keeper, the catalogues are virtually done by your staff?—That is so.

Would you dream of going outside your staff to catalogue your coins, or your Greek vases, or your antiquities?—Certainly not.

And the same with the library?—The same with the library.

And you make the man, the keeper, virtually responsible for the cataloguing of his own department?—Yes.

As to the cataloguing. In the first instance, I believe, there is an inventory?—Register, as we call it.

What does the register consist in?—The register is a book kept for entering up in very brief form the acquisitions as they come in.

Is there a separate register for each department?—Oh, yes.

How are the things registered, according to classes?—No, as they come in, as a rule; the one after the other in numerical order.

Have you any classified list afterwards?—Then we make catalogues on the registers; those become the classified lists.

If a student comes into the Museum and wants to see a particular object, and knows its history, where can that be found without looking through the whole inventory?—The internal arrangement of the department would help.

That virtually would have to be postponed, that kind of knowledge, until the cataloguing of the department is completed?—In minute detail, of course; but of course the officers of the department know where the things are, and they can always assist students in finding them.

What portion of the time of your keepers is devoted to cataloguing do you suppose and inventorying your objects, and what portion to the actual supervision of the objects in the cases?—I do not quite follow; you mean of the staff generally?

Yes?—A good deal depends on the department. You must rather divide our Museum into two sides; we have what I should call the literary side and the archaeological side. On the literary side, of course, we have to catalogue to let people know what we have. On the archaeological side a great deal of exhibition comes in, and then, of course, a good deal of time is taken up in putting out the objects in the galleries, and labelling and so forth.

We have been told that at South Kensington it has been impossible for the staff to catalogue their own collections, because the staff is not sufficient in numbers, and there is not sufficient time?—You must have sufficient numbers, of course.

Have you any notion of the number of objects which is under the control of the keeper of any one of the departments or more than one of them?—It is impossible to say. I could not tell you. For example, in the printed book department you have something like two millions of books.

Would not your inventory tell you?—Yes, the inventories of the different departments would tell you.

As a matter of fact, in one department, the coin department, have you not published thirty volumes of catalogues?—Yes, very good catalogues, a very good series.

Entirely by the staff in that department?—No; some of the ordinary coins were done by outsiders, but as a rule all the ordinary catalogues are done by the staff.

Who is responsible for the custody of the building with regard to its safety and otherwise?—I am.

With regard to fire and with regard to policing, is it under the police authorities, the metropolitan police?—No; we should call in the Fire Brigade in case of fire.

Have you a special staff of firemen of your own?—Yes. It is a small staff, only four firemen.

Are you subject to supervision at all by the officers of the Metropolitan Fire Brigade—do they come and inspect?—Yes, up to the present time, as far as I remember, we have always had the chief officer of the Fire Brigade; he has been our superintendent of fire-engines, and we have given him a small fee. At present the County Council will not allow their officers to take fees, but Commander Wells takes the duty voluntarily, and he is allowed to come and inspect our place once a quarter.

Does he make you a report?—Yes.

As to safety?—Yes.

And so far as your experience goes, have his recommendations been carried out?—Always.

And you deem him as partially responsible for the safety of your buildings?—So far as a referee.

In regard to police, the staff which is employed in the Museum, is that a special staff?—No, they are supplied by the Commissioners of Police.

Do they change their men?—Oh, yes. As a rule we keep on the same men, but of course they are constantly changing within the force itself by retirements, and this keeps a flow of new men through the place.

Have you a separate staff over-night?—No, the same men have to take the rota; there are very few on at night, only one inside; four men and a sergeant altogether on duty at night. In the daytime, of course, we employ twenty-eight, including an inspector and two sergeants.

As to the attendants in the rooms, they are for the most part in your Museum laymen, not policemen or soldiers?—No, we are gradually shifting all our warding attendants and putting in police and commissionaires. We use a policeman in a long gallery and we consider him worth two ordinary men. In a small room it would be waste to put a policeman, and we put a commissionaire, as he is much cheaper. By degrees we are displacing all the old attendants or servants who used to ward the galleries; it was not found an efficient system at all; they went to sleep, and so on; and then the public did not, of course, quite attend to a man in plain clothes as much as to a policeman in uniform or to a commissionaire; we find the present system very good.

You mean the attendants who were appointed under the patronage of the three senior trustees?—Yes.

They are gradually being displaced?—Yes, those who used to be employed in warding. I am only speaking of the warders. Of course, in each department we must have attendants as servants.

And those attendants are still the class of men I have referred to, that is, old servants and others appointed by the three senior trustees?—They are partly old servants, but latterly we have been introducing a system of boy attendants. The general service tends to rapid increase annually; we require more hands and more hands, and we find it is better to have boys. They are more active; they can run about quicker and serve books more quickly than the men, and by degrees we have brought in a very large number of boy attendants. The Treasury will always allow us to engage two boy attendants if we get rid of one attendant.

Chairman: What becomes of the boys?—As a rule, when a boy does well, I get the principal trustees to nominate him as an attendant, and they generally will do so. All appointments are in the hands of the three principal trustees, and if I recommend a boy very strongly they will always give him an attendantship.

Sir Henry Howorth: Your better boys are drafted into the upper class of attendants?—They are nominated afresh, not promoted, but we find no difficulty with our boys; I mean in keeping the flow, for so many of them get appointments outside. We train them very carefully and they are all well taught and

looked after very sharply; outside people are beginning to find this out, and they have been drawing on us lately rather too largely. The boys get into commercial places and so forth.

Have you in your recollection ever had anything stolen out of the cases?—Yes, once, a long time ago—twenty years or more. A German student, who knew something, managed to steal some of the Assyrian cylinders and ivories. They were very few, but he managed to force the case and get hold of some of these, and took them abroad and sold them or pawned them in Holland. I think we recovered them all.

Is that the only theft?—That is the only thing I can remember being stolen from a case.

In the library have you had anything stolen or mutilated?—Occasionally we lose a book. A reader will carry off a book, but very rarely, and I suppose, perhaps, in the last six or seven years we have not lost half a dozen books; and they are always common cheap things—2s. books.

Have you had any mutilations of valuable books?—No, I do not remember any; the only mutilation as a rule that takes place is when they have cut out an engraving.

Have they not cut out the margins of certain famous books?—There was a case some time ago of a German who mutilated some of Bentley's books. It is a misfortune that the Germans know too much. This man was really a student.

And he was a specialist?—Yes, he got hold of Bentley's volumes and appropriated his notes; he was a classical scholar and brought out discoveries of his own which were really Bentley's, and in order to cut off the evidence, he cut off the margins of the books.

What are the precautions you take, that is what I am really driving at, against theft and against mutilation in this way; have you had any special recommendation as to cases?—As to the exhibition cases?

Yes?—We take the advice of the Office of Works; the head of that department always advises us on the large cases and so forth, and then, of course, we are particular about our system of keys and locks. Everything is made as secure as possible.

Is all the furniture for the Museum made by the Board of Works?—No.

Do you make a portion of it yourself?—No; we get it made by contract, but we take the advice of the Office of Works. But payments are made from our vote.

Do you think it would be an advantage that you should make a portion of your own furniture at all. Do you see any advantage in that?—No, I do not think we should in the large cases, except as a matter of expenditure. Formerly, when we managed our own affairs, perhaps our cases were really better than they are at the present time; for instance, we used gun-metal a good deal, which makes better cases than wood; but with the estimates cut low we are obliged to put up with the cheaper material. I must say that the cases are generally very well made; we go to the best men, for instance, Cubitt and Holland.

With regard to fire, have you ever had a fire in the Museum in your knowledge?—Yes; in 1865 there was a fire in the binders' shop. That was an outbuilding.

Where was the binders' shop?—On the east side where the white wing now stands.

Is it detached?—Are you speaking now of the present binders' shop? At the present day the binders have to work in the basement of the Museum. This is objectionable, I consider, and we have been trying to get the Treasury and the Office of Works together to build us outbuildings; and with that view, after the purchase of the surrounding property was made two or three years ago, we arranged then that we should cut off the lower part of the gardens of some of the houses so as to widen our roadway, and within that roadway we proposed in this year to build a long row of shops, and to put the binders into them. The objection to the binders working in the basement is that they use fire. We should have put them in those outbuildings, but unfortunately the grant was disallowed, and at the present moment we are having a struggle with the Treasury and the Office of Works to get them to do something.

With regard to the furnaces of another kind; for the boilers, and for the gas installation?—You mean the electric light?

Yes?—They are kept away from the Museum as much as possible. Unfortunately some are down in the basement.

You still have danger from them?—Yes, we should get rid of them by degrees; the last boilers we put under the roadway outside. I do not mean the public roadway, but our own roadway surrounding the Museum.

The houses of the keepers which are within the same great block of buildings, are they separated?—Yes; they are wings. They are only connected with the Museum by small corridors. My house, for instance, on one side, and the first house on the other side; the others are all independent.

You light the Museum entirely by electricity?—Yes. Well, we use gas to some extent, not upstairs, but among the shops downstairs in the basement; but we are displacing that as much as possible with electric light. We have our own plant, and we can run almost as much electric light as we want.

I believe you light one half of the Museum at a time, you do not have it lighted all together?—Not all together.

What provision is made now in the evenings in regard to relieving your staff; is there any extra pay given to the men who stay at night?—As a rule we do not have the staff remaining at night; all the attendants clear out. We only have one assistant as a responsible person, and he is paid extra, of course, but the warding is all managed by the police and commissionaires and the resident messengers and a few labourers; the police have to work eight hours a day, and anything beyond the eight hours they are paid for. An officer is also always in residence.

You have never had any charge in the Museum for entrance at all?—Oh, dear no.

Have you a system of students' days on which certain departments are closed?—On the east side of the building the ethnographical department has been closed on Tuesdays and Thursdays, and this is the last relic, I may say, of keeping the place closed.

Do you see any advantage in that?—No, I think we shall open everything; the only advantage of observing closed days is that it keeps the place a little cleaner.

And you see no advantage in having a charge for reserving certain days for the students?—I do not think so at all. Now almost every department has its students' room; we are increasing that system a good deal through the place, and besides it is very easy to rail off a piece if students want to draw or study anything particular; it is easy to draw a barrier across and prevent them from being interfered with by the public.

With regard to the control by your trustees, how often do they meet?—At our place once a month, and at the National History once a month.

That is a committee of your trustees?—The standing committee it is called.

Are they selected from the rest?—Yes.

By themselves?—By the general meeting.

They are co-opted by the general meeting of the trustees?—Yes.

And they meet once a month?—Once a month at both places; they meet the second Saturday in the month at our place, and the last Saturday in the month at the Natural History Museum.

What is brought before them, as a matter of fact?—The general business, of course. I act as secretary. All the reports from the different departments and the reports of the general administration, and so forth; anything that comes up in relation to the public; in fact, everything is brought before them.

EDINBURGH ARCHITECTURAL SOCIETY.

THE second annual dinner of the Edinburgh Architectural Society took place on the 22nd inst. in the Imperial Hotel, Market Street. Councillor Cameron, the hon. president, was in the chair, and the croupiers were Mr. W. N. Cumming, the vice-president, and Mr. J. F. Matthew, the hon. treasurer.

Baillie Mackenzie proposed "The Edinburgh Architectural Society." Speaking, he said, from a plain man's standpoint, he admitted that there were very fine buildings to be seen, with great detail on them, but he did not know that the public were sufficiently educated to appreciate such buildings. He did not doubt that there were beauties in such buildings if ordinary people were able to see them. But, after all, too much elaboration of a building had always seemed to him to be like an ugly woman overdressed in silks and satin. In the education of the professional architect he thought sometimes that there was a defect, in that the students did not study the kindred branches of the profession in regard to physics, chemistry and electricity. Architects, he thought, lost sight of these in pursuit of what was purely architectural detail. For example, he believed that a little knowledge of electricity and of electric lighting would be of great service to young architects.

Mr. Jas. A. Williamson, the president, responded for the Society. The Society, he said, had now been founded for two years. It consisted of junior members of the profession, and it had cut itself adrift, to some extent, from the older Association. Whether that policy was right or wrong it was not for him to say, but they felt that their own individuality was the very life of the Society. There was a disposition on the part of the older Society to take that, the younger Society, under its wing; but, apart from questions of policy, they could not overlook the fact that, so long as they had the funds to carry on the Society, and had life and vigour, they were perhaps better to remain independent. Mr. Williamson afterwards proposed "The Corporation," and said that they, as architects, had reason to congratulate themselves that the members of the Town Council were very jealous of the amenities of the city. They had an instance of that in the attitude which the Lord Provost had taken up with regard to the proposal to put up an electric sky sign in the Old Town.

Baillie Pollard, in acknowledging the toast, said that the Corporation were engaged in a great many matters that were purely architectural. For example, there was the rebuilding of the North Bridge Street, and he hoped, in that connection, that the Town Council would not be so far left to itself as to become the builder of the street. Then, again, the Corporation had in hand the matter of the Usher Hall. He did not feel, as a member of the Corporation, that they had very much credit in alluding to that question. He was sorry that the Corporation had not been able with greater promptness to show their appreciation of the most handsome gift of Mr. Usher by finding a site for the hall before the present time. He hoped, however, that before very long a suitable site would be found, and that Mr. Usher would have the satisfaction—and it was the only satisfaction that he desired—of seeing the hall in use during his lifetime. Other toasts followed.

SOUTH KENSINGTON MUSEUM.

ANOTHER Old English room has been set up in the western arcade of the South Court by the side of the "Inlaid Room" from Sizergh Castle. It is from an old house, now pulled down, at Bromley-by-Bow, and belongs to the early years of King James I., the date, 1606, having being carved on the outside of the house. The spacious stone fireplace has over it an elaborate mantelpiece in oak, with the royal arms very boldly carved. The ceiling bears in the centre the same arms with the initials I. R., and is covered with fine strapwork ornament having floral enrichments and medallions containing heads of ancient warriors. An extensive alteration was made in the last century whereby the room was shortened and the panelling was shifted to suit the new conditions. A few mouldings and door-heads of the latter period have been left out, as they were in pinewood, and consequently appeared incongruous by the side of the old oak; the room is therefore more nearly in its original form than when demolished. Specimens of furniture of the period have been taken from the Museum and arranged in the room in order to give it a furnished aspect.

The rooms in the picture galleries formerly given up to the pictures of the Chantrey Bequest have now been hung with water-colour paintings which were previously on screens. Many interesting works can thus be seen to greater advantage, but this change is only provisional.

The arrangement of two rooms in the Cross Gallery connecting the Indian Section and Science Collections has now been completed. The first room, on descending the staircase, is devoted for the most part to Cairene art; three of the well-known lattice windows are shown here with their curious projections for holding water-bottles; on one side is a mosque pulpit of wood decorated with delicate carved ivory plaques; specimens of doors with similar ivory plaques are arranged in cases against the walls; casts of architectural ornament from the mosques of the Sultan Hassan and Kait Bey, and the Wekaleh of the latter Sultan, fill the upper parts of the walls and the corners of the room. In the second room are textile fabrics and embroideries from various parts of the Turkish empire. To the left are brocades and velvets, probably from Broussa, while to the right are the remains of seventeenth-century brocaded dresses from the tombs at Constantinople of young princesses. The screens contain embroideries in endless variety of stitches from Syria, the islands of the Levant and other parts of the East; against each of the long walls is one side of a room from Damascus, one of the early eighteenth century and the other about fifty years later, with their quaint cupboards and recesses. On the ground floor of the Indian Section an important addition has been made to the plaster casts by a collection of ornamental details from the palace of the great Akbar at Fathpur Sikri, near Agra.

WROTTESELEY HALL.

THE following description of Wrottesley Hall, near Wolverhampton, which was consumed by fire on the 16th inst., appears in the "History of Tattenhall," by Mr. J. P. Jones:—

Wrottesley Hall stands in a commanding position, on the summit of a thickly wooded slope leading from the main road through the park, and is a conspicuous object from many points of view in the parish. The hall was built in 1698 on the site of an old picturesque manor-house, which was unfortunately pulled down to supply material for the new house. Originally the old Holyhead road ran through the park and passed in front of the hall. Since the diversion of this road, the chief approach to the house has been from a point on the present road, about a quarter of a mile beyond the fourth milestone from Wolverhampton. The present building is a plain rectangular structure of red brick with stone dressings, the flatness of the front being pleasantly relieved by two projecting wings. The principal entrance is approached by a flight of stone steps, and opens into the hall, a spacious and lofty room. From the hall access

is obtained to the drawing-rooms, which occupy the whole of the ground floor of the west wing, the windows of which look out upon the terrace and gardens. The dining-room is parallel with the hall and is upon the site of the cloisters of the old hall. From its windows are obtained fine vistas of mossy turf and winding woodland paths leading into the home park. Over the dining-room is the library. Every inch of wall-space in this noble room is occupied by shelving to receive the large number of volumes it contains. Amongst the treasures of the library are a first folio of Shakespeare, many early and rare editions of the Classics, a copy of "De Bry's History" and one of the finest and most complete sets of ancient historical chronicles extant. Leading from the library through a winding passage is the entrance to the Wrotesley muniment-room, where are stored priceless treasures of historical deeds ranging over a period of 700 years. These deeds and MSS. are valuable not only as the title deeds of a private family, but as containing much that would cast a new light upon the history, manners and customs of England during a very extended period, and especially is this so as regards the mass of materials for the history of the sixteenth, seventeenth and eighteenth centuries, contained in the various letters which abound in the collection. Taking them in chronological order, the rarest of the numerous deeds at Wrotesley is that of Robert de Stafford, giving Wrotesley and Livingston to the monks of Evesham. Then there are deeds of the twelfth and thirteenth centuries; one MS., which curiously illustrates the power of the Church at the end of the fourteenth century, is the letter of excommunication printed under Tottenhall Clericorum. Among the documents is a copy of the earliest statutes of the Order of the Garter, finely written on two membranes of vellum. There is also an ancient historical roll, nearly 20 feet long; it contains the history of Britain, preceded by a tabular conspectus of the Heptarchy, and portions of it are upon the history of the British kings. On the back of this roll is written, in contemporary handwriting, the pedigree of the claimants to the Crown of Scotland in the reign of Edward I., together with a copy of the deed of submission to the competitors. This part of the document is of considerable interest, as the character of the handwriting shows it to be contemporary with the events which it describes.

TESSERÆ.

Indian Ornament.

ABSENCE of symbolism is the weakness of modern European decoration, as, indeed, it was of Grecian; and yet, what conventional form is more beautiful than the French fleur-de-lis, more beautiful and worshipful than the Tudor rose, or than such heraldic symbols as the cross crosslet? And the most natural decoration for wall-papers, curtains and book-lining papers would be, for people who could afford it, to use family arms alone, or in combination with national symbols and conventionalised representations of national flowers or animals. But no symbols can approach in beauty of form and meaning to the knop and flower and the *hom* of Assyria, and purified of all local taint of Asshur, Ashtoreth or Astarte, they belong to all the Aryan races in the old world and the new. They are probably the most ancient badges of the Aryan race, but in India their employment in ornamentation under the influence of the Turanic mythology was for ages subordinated to that of the monstrous idol shapes of the Dravidian south, and it was by the Persianised or Arianised Arabs, Afghans and Mongols (Turkomans) that their use was reintroduced as predominant forms in Indian decoration, wherever throughout Hindustan and the Dakhan Mohammedanism prevails. They are seen figured everywhere in oriental art, and we cannot take up a talisman of Egypt, a Syrian silk, an alabastron of Persian perfumes, or a Persian illuminated MS. or carpet, a Cashmere shawl, an Indian jewel or kincob, any of the great store of these splendid and precious stuffs and arms, and vessels of wrought gold and silver, on which we do not find them represented, as the acknowledgment in their original use at least of the Divine Author and Finisher of every good and perfect work; under forms taken from the most majestic of trees and the most graceful of flowers, and which express more simply, directly and fully than can any form of words the wisdom and beneficence of the Creator and the gladness and praise of men. Thus Indian art in every decorative detail, Aryan or Dravidian, bears witness to the universal conviction that the character of man's being and destiny is supernatural; and that human duty and all that gives to daily intercourse the charm of art and grace of culture, possess their reality and true meaning only in the purposes of a life beyond life.

Consistency in Architecture.

To adhere accurately to any given style demands an intimate knowledge and close observation of its peculiarities, involving the necessity of a laborious and attentive study. This necessity is apt to breed a disposition, first, to depreciate, and

then to disregard all study of this nature—a study very unwelcome to the indolent and very distasteful to the self-sufficient student, who spurns the trammels of consistency, and who, ambitious to strike out a path of his own, would fain believe it to be beneath him to regard very narrowly the trodden paths and the more frequented highways of his art. No mistake is more dangerous than this; the only safe ground for hope of future progress lies in a clear and comprehensive knowledge of the past, and he who is earnestly anxious to extend the bounds of art must first make himself thoroughly acquainted with all that lies within those bounds. The contempt for consistency of style gives birth sometimes to very strange spectacles, many singular compounds of discordant types. We shall find perhaps very high-pitched roofs or French rococo work laid upon a structure having visible pretensions to Palladian art, whilst scattered glimpses of Elizabethan manner give to the heterogeneous mass still greater grotesqueness. Such are the deplorable results of the neglect of style. Be assured that no genius, however commanding, can indulge in these anomalies with impunity; whilst for the student of ordinary powers to venture upon them would be an act of imprudence which no sensible man would commit. It may be said that to inculcate so careful an adherence to style would be to set up a slavish doctrine, to shackle the fancy and to limit the freedom of genius. But this would be an error. As consistency of conduct in the ordinary affairs of life is an evidence of stability of judgment, so æsthetic consistency is a proof of a taste based on sound and intelligent principles. This consistency of style is peculiarly a mark of the best periods of art, and will never fail to be found to distinguish the productions of the best masters. If, for example, we examine the *chefs d'œuvres* of the thirteenth century we shall be offended by no inconsistencies. One portion of the building appears to arise necessarily out of or to be necessarily dependent on the adjacent portions, and generally a natural sequence of parts tending to one homogeneous whole seems at once manifest—a pervading principle, in short, appears throughout the structure. So in the best works of the great masters of the Renaissance period there is a well-regulated congruity of manner testifying that the artist was influenced by fixed principles, and that his work was as much the result of good sense as of good taste, or, rather, that these two qualities are necessarily associates of each other, for it cannot be too strongly impressed upon all how close a relationship it is which exists between them. The educated eye refuses to be pleased with that which is irreconcilable to reason in however fascinating a form it may be presented to the eye.

Theodoric's Mausoleum.

The mausoleum of Theodoric, raised during his lifetime (not, as conjectured, by Amalasunta under the reign of his grandson), is a marvel of construction, though by no means admirable in decorative details. Sharing the fate of those of S. Helena and S. Constantia, near Rome, it was at some Mediæval period dedicated as a church, S. Maria Rotonda, but is now again left to silent solitude, having been long since robbed of the sarcophagus in which Greek bigotry would not grant the repose of the tomb to an Aryan sovereign. A decagonal structure of marble, it rises with an upper storey on a high basement, at each of whose ten sides opens a deep recess under a semicircular arch; the interior, reached by two outer staircases added in 1780, is circular and quite plain, lighted by small windows opening near the summit between a simple band and a cornice, and roofed by a stupendous cupola one solid mass of Istrian stone, measuring in diameter 10·4 metres, from the base to the summit 4·5, in thickness 1·44; weight estimated at more than 200 tons, and by Ricci at 4,000,000 Roman lbs., about equivalent to that of 18,000 or 20,000 men in the scale together. Not, indeed, a beautiful but a striking object, this extraordinary tomb rises among woods at a short distance from the city, where a sylvan scene of quiet loveliness surrounds the monument of eventful history and perished nationality. It is popular belief that a huge porphyry urn like an antique bath, found near the outside of this building, and now standing below the ruins of Theodoric's palace in a street, is the violated tomb of that prince, but authorities decide against this local tradition; as also against the idea that the lost sarcophagus had stood on the summit of that massive cupola, the interior being its suitable place.

Coloured Sculpture.

In one of the dialogues of the fourth book of Plato's "Republic," Socrates, who was not only the son of a sculptor, but for some time himself wrought at the profession, is made to remark:—"Just as if when painting statues a person should blame us for not placing the most beautiful colours on the most beautiful parts of the figure—inasmuch as the eyes, the most beautiful parts, are not painted purple, but black. We should answer him by saying, 'Clever fellow, do not suppose we are to paint eyes so beautiful that they should not appear to be eyes.'" This passage alludes to the painting of statues—the word for

statue being *andrias*; but it does not say that the flesh was painted, nor that these were marble statues which were so treated. We ourselves in our towns possess painted statues of wood, as in those of that distinguished North Briton of which we still remark images in some of our old snuff-shops. The Greeks also, as Pausanias informs us, had in their gardens and groves figures of plaster and wood which were painted. By this people, however, without doubt, many statues were painted of a much higher order than these, and even occasionally those of their gods. Another remarkable passage from the ancient authors, brought to bear on this subject by the polychromists, is that from Pliny (lib. xxxv. cap. 2), in which he says, speaking of Nicias the encaustic painter, that Praxiteles, the great Athenian sculptor, when asked which of his marble works best satisfied him, replied, "Those which Nicias has had under his hands." So much," says Pliny, "did he prize the finishing of Nicias" (*Tantum circumlitioni ejus tribuebat*). Now the whole force of this passage turns upon the meaning of the word *circumlitio*. In the dictionary this word is translated "polishing," as indeed its derivation points out. But the polychromists say that Praxiteles could not have meant polishing. Nicias, they say, was an encaustic painter, i.e. one who painted in wax, laid on with heat; and that, therefore, *circumlitio* must have meant painting the statues in encaustic. This statement, however, contains no evidence, and may be taken as an example of what is called "begging the question." A little circuit perhaps may bring us round to a truer explanation of the passage. At times of festivity the Greeks delighted to oil their bodies, as did the Romans also—a somewhat barbarian practice, as it seems to us now, but so they did. To give a similar shine and gloss to their statues they occasionally waxed them, as the Romans did also. Nicias, as no doubt he used the best wax for his pictures, may probably have superintended this process for such of Praxiteles's statues as that sculptor prized the most; and there ends the whole story, for not a word is said about colour in it. Moreover, the question put to Praxiteles was rather a searching one, "Which of your statues do you like the best?" Also a direct answer might have given offence in some quarters. Thus however did he parry it gracefully by saying, "Those which Nicias has had under his hands." The whole misapplication of this passage seems to arise, not from what Praxiteles himself said, but from what Pliny has volunteered—*Tantum circumlitioni ejus tribuebat*—"So much did he attribute (or ascribe) to the polishing of Nicias." The truth is that it was as pretty a *captandum* speech—one such as Pliny loved to record, and as such has been handed down with a force and meaning attached to it to which examination shows it has no claim.

Art and Race.

The external world or globe we inhabit may be looked on as composed of two classes of objects—one great class invented by man, the social arts, as they are called; of a second great class of objects formed, created, or developed by nature. The objects made and invented by man constitute a large portion of human civilisation, and, indeed, without them civilisation does not exist. As wealth and the civilisation mainly occupied with the invention of the social arts advance, the nation and race recede further and further from nature, according to the disposition of the race; for nature's objects they substitute the artificial, their own inventions; and this may go on, as in China, until nature be all but put out of court. A race strongly disposed to admire their own inventions are generally despisers of nature and of truth, which resides only in those objects which nature forms. Thus, in estimating the character of a race, we have only to discover from what point of view they contemplate the material or external world; what value they attach to their own inventions, and what to nature's creations. The arts which man invents, and which so many races and individuals of all races admire and esteem beautiful, are constructed on principles addressed to certain faculties and instincts of the human mind which man values highly. They are addressed to his love for parade and magnificence, order, symmetry, grandeur, nicety of workmanship, difficulty of execution. When the objects thus invented and carried to perfection are presented to him, he calls them beautiful, esteeming them highly as the perfection of human handiwork. But he never imagines that there can be any truth in them excepting the mechanical, and he does not look for truth, knowing that utility is their aim. As regards all such inventions there is no standard of taste, each generation despising the inventions of the past, and more especially of the labours of the immediately preceding age. The reason why each generation when in its prime and vigour despises the inventions, thoughts, ideas, actions of the immediately preceding generation more than any more ancient one is this: the generation about to depart is before them in a senile, feeble, decaying and decrepit form, and the thoughts of the young and vigorous naturally class together the declining race and their inventions. In the presence of the aged and enfeebled everything connected with them, mentally or physically, seems redolent of antiquity—

dress, thoughts, inventions. It is not so with the generations which have passed away, of whom we are more likely to remember whatever was vigorous, youthful and great. But in contemplating nature's creations, and the imitations of such objects by the true artist, whether in marble or on canvas, the highly organised mind sees in the object the truth of nature, and demands in the imitation by the artist the presence of beauty and of truth. He is sensible that man cannot alter, cannot improve, although he may disfigure, nature's creations.

Patents for Inventions.

Invention is civilisation. The inventor is the first man in the world; for he makes something out of nothing, gives a value to what was valueless, motion to inert masses, power to weakness. Watt, in imprisoning steam in a cylinder, has given England fifty millions of hands; nature had not furnished her with this immense appliance. All which exists on the side of brute nature is the work of invention. Inventors seek out and find new processes, simplify mechanism, diminish bodily labour, shorten distances, explain phenomena, subdue the elements and transmit them tractable and powerful into the hands of men. They are the head and soul of a nation; without them there can be neither progress, nor riches, nor power. The country which possesses the most of them renders its neighbours tributary and subservient to itself. Other nations will buy its books, pictures, designs, colours, stuffs; they will require also its laws, regulations, plans; they will visit its monuments, depositories, schools—for all this is so much invention. Mind works equally in the arrangement of a chart or a poem, a picture or an art; while one genius combines parts of machinery, another arranges hemistichs and rhymes, lines and colours, black and white. The people which have no contriving powers are savage, and they remain so until the inventor civilises them. Cadmus, Triptolemus, Oannes, Moses, Mohammed, Leibnitz, were inventors. An idea is the property of him who first possesses it. It belongs to him, were it only by the natural right of the first occupant. He has the power to promulgate or to conceal it. It belongs to him with a juster title than the field or the forest, which may be inherited; for, if you had neither your field nor forest, another would enjoy it; you have not made them, but the inventor has made his discovery. Every invention or importation constitutes an addition to the common stock, since it will employ workmen, make things useful, revive commerce and industry, bring in foreign capitalists or prevent our own from going to seek other products elsewhere. The office of patents ought to be simply the body corporate of inventions. A patent there deposited is nothing else than fixing a determined date, which ought not to cost more than the inscription of the birth of a child. Inventors and importers, who place their industry under the protection which the law offers them, have then a right to the protection and the encouragement of every government which comprehends its own interests and those of the people whom it governs; it would be shameful to deprive them of it in countries where alien laws and confiscations are abolished. The smaller a country is the more ought it to offer facilities and attractions to inventors, in order to induce them to endow it with their industry. If they only find dislike and opposition on the part of the rulers, not only do they retire, but even the inhabitants themselves of that very country convey the product of their own industry where it meets with encouragement; for it must be allowed that the successful alone have a country, all other persons are cosmopolites.

GENERAL.

The Exhibition of Paintings by the late Sir J. E. Millais will be opened at the Royal Academy on Monday next.

A Site has been purchased in Luton for the erection of a theatre at a cost of 14,000*l*. The local authorities have approved of the plans.

The National Gallery and Tate Gallery will not be opened on Sundays during the winter, but it is likely the Sunday opening will henceforth be continued until the end of October.

Messrs. Mallows & Grocock having obtained first place in the competition for the Newark School of Art have been appointed architects for the building.

Mr. M. W. Carr has been appointed consulting engineer to the Agent-General in London for the Colony of Natal.

The Imperial Household Department of China has lately memorialised the Throne asking permission to build a light railway between Peking and the Imperial mausolea. It appears that every time a member of the Imperial family or the harem dies it costs the Department some 300,000 taels to 500,000 taels to transport the remains to the mausoleum, whilst in the case of a deceased emperor or empress dowager no less than 2,000,000 taels are usually expended for transport purposes, &c. Hence the idea of a railway is to save such exorbitant expenses, and it is believed that the Emperor will sanction the scheme.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

authors of signed articles and papers read in public must necessarily be held responsible for their contents. communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

WOODLESFORD.—July 6.—For erection of three cottages. Mr. Robert J. Smith, architect, 61 Albion Street, Leeds.

It is surprising that the picturesque old town, Market Harboro', with its central position, has not been invaded by the speculative builder long ere this. We are told that there is a great lack of really good houses in the neighbourhood, which, if built, would be quickly filled with residents from Leicester and other large manufacturing towns. A good deal of building has been done during the last few years, but there are any number of fine sites in the market and good business might be secured.

MR. J. BATCHELER, who for many years represented Messrs. Merryweather & Sons, Limited, and the "Titan" sprinkler, has now become a partner in the firm of Haines & Co., 29 Minories, E.C., engineers' furnishers, and the sole agents for the "Nobro" portable fire-engine.

BUILDING AND BUILDERS.

THE foundation-stone of a new Roman Catholic school at Rivington Road, Newtown, a new working class district which has rapidly risen in St. Helens, was laid on the 28th ult. The schools, which will accommodate 360 children, will cost about 3,000*l*.

IT has now been definitely settled that the new post office, about to be erected to meet the increasing business of the postal department in Kirkcaldy, which has been growing very rapidly of late years, will be placed at the west end of Hunter Street, on the ground belonging to Mr. John Hunter, St. Brycedale.

THE foundation-stone of the new marine drive and promenade round the Castle Hill, Scarborough, to connect the two bays, was laid on the 25th ult. The Lord Mayor of York and the Mayors of Hull and Harrogate were present. The construction of the new marine drive and promenade, at a cost of about 80,000*l*., was undertaken some months ago, but the foundation-stone laying was deferred so that it might form the principal feature of the local celebration of the Diamond Jubilee. The new drive is to be 4,100 feet in length, and commences from the southern end of the Royal Albert Drive, and will join the drive in front of the South Bay, thus making one long, continuous marine drive of 3½ miles.

IMPROVED SERVICE TO BRUSSELS.—In connection with the Brussels Exhibition and the popular Belgian and Swiss tours, *via* Harwich and Antwerp, the Great Eastern Railway will shortly transfer two of their new steamers, which have hitherto run on the Hook of Holland service, to the Antwerp service. These or other vessels will be run from July 4 to September 12 inclusive, on Sundays as well as weekdays. Passengers will now be able to leave London on the Saturday night, and the North and Midlands in the afternoon, reach Brussels next morning by train running from alongside the steamer, and return on the Sunday evening, reaching town first thing Monday morning. The new steamers are ocean-going vessels of upwards of 1,740 tons, and 5,000 indicated horse-power, with comfortable sleeping accommodation for about 200 saloon passengers. The journey permits breakfast being comfortably taken in the River Scheldt, while in the opposite direction a *table d'hôte* dinner is served soon after the steamer leaves Antwerp.

ARMOURED DOORS

TRADE NOTES.

THE new intermediate girls' school, Abergavenny, is being warmed and ventilated throughout by means of Shorland's patent Manchester grates and patent Manchester stoves. Messrs. E. H. Shorland & Brother have just ventilated Baines School, Blackpool, by means of their ornamental patent exhaust roof ventilators and special inlet tubes.

MESSRS. GREEN & CO., of 236 Bradford Street, Birmingham, have taken advantage of the Jubilee time to bring before the public their latest improvement in Green's reversible

GREEN'S JUBILEE LOCK

cylinder bolt locks, that were formerly manufactured by Mr. John Green, the inventor. The cylinder bolt lock made by Mr. Green held, years ago, a very prominent position in the

market, and Messrs. J. Green & Co. now wish to introduce this lock again in its improved and perfected state. They claim for it that it is the very best mortice lock on the market for ordinary use, besides being one which they think should be specially popular with architects for public buildings where large suites are required to differ, and master keys to pass in sections with grand master to lock all. Their No. 104 lock is suitable for such purposes, and they are prepared to make them in different qualities with the improvement to the old numbers, viz. No. 0 and Defiance 01, 101, 102, 104, which are as well known on the foreign market as at home.

THE offices of *Timber* have been moved from 44 Bishopsgate Street Without, E.C., to new and more commodious premises at Middlesex Street, Bishopsgate Street Without.

MESSRS. BERRY & CAMPBELL, warming and ventilating engineers, 17 Ridge Road, Hornsey, London, N., have secured the order for heating the premises of the American Type Founders' Company (Mr. P. McCoy), Phoenix Works, Phoenix Place, W.C.

VARIETIES.

THE mansion-house of Caldra, in Berwickshire, the seat of Colonel Milne Home, was recently entirely destroyed by fire. Most of the furniture and plate were saved.

OWING to the rapid growth of the district, consequent upon the establishment and extension of the chemical works of Messrs. Brunner, Mond & Co., Limited, it has been found necessary to build, at a cost of 5,000*l.*, a new church at Winington, near Northwich. The new building was opened on the 28th ult., and will seat 320 persons.

THE extensive premises of the Original Brewery Company at Cheltenham were almost destroyed by fire on Sunday, the 27th ult., the damage being estimated at 100,000*l.* The fire is believed to have been due to the spontaneous combustion of some hops. It soon got a firm hold upon the immense plant, and it was with difficulty that the fire brigade saved the stabling and malshouses.

AN inquest was held at St. Bartholomew's Hospital on Friday last upon Michael Linaham, forty-eight, the labourer who met with his death while working on the Jubilee decorations at the offices of the *Daily Telegraph*. Deceased lost his

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT, E.C. Architects and Buyers are respectfully invited to inspect same.

footing on a ladder and fell 20 feet, a miraculous circumstance being that no one else was hurt by his fall, although the pavement was crowded at the time. A verdict of accidental death was returned.

THE opening of the new Roman Catholic church of St. Chad at Kirbymoorside took place on the 15th ult. The church is situated near the railway station, and forms a handsome addition to the architectural features of the place. The church is built from the plans of Mr. Bernard Smith, of Gray's Inn Square, London, and when completed will seat about 120 persons. The wood-block flooring throughout was executed by Nightingale & Co., Grimsby Wood Pavement Works, Great Grimsby.

At Wilmslow Sessions the District Council applied for an extension of time in connection with their sewerage works. It was stated that important works had yet to be carried out on the southern side of the district. The northern scheme has just been completed at a cost of nearly 7,000*l.*, and 12,000*l.* has been expended in the southern district. The Mersey and Irwell joint committee had agreed to six months' extension. The Bench granted the extension.

THREE cottage homes, built by the Hunslet Board of Guardians for the accommodation of children hitherto inmates of the workhouse, were opened at Rothwell Haigh on the 24th ult. The cottages, which are built of brick, contain a sitting-room for the foster-parents, a day-room, kitchen and scullery on the ground-floor, and four bedrooms above. There is also an isolation-room in each. The buildings stand in 4 acres of ground, the unoccupied part of which will be turned into gardens and playgrounds. The total cost of the undertaking has been 8,500*l.* Mr. E. J. Dodgshun, of Leeds, was the architect.

THE town clerk of Leeds (Mr. John Harrison) has received from the Secretary of the Local Government Board an intimation of the Board's approval of the land at the Ivy House estate, which still remains in the hands of the Corporation, being utilised for the erection of houses for persons of the working class, who will be displaced by the execution of the Corporation scheme relating to this area. The Board approve the proposals of the Corporation for laying out certain new streets, 60 feet wide, to open out the area, and the arrangements into which, subject to such approval, the Corporation had entered with the Yorkshire Pure Ice and Cold Storage Com-

pany relating to the piece of vacant land lying between Harper Street and Cross York Street and abutting on York Street.

UNDER the Employers' Liability Act an action was brought by Albert Roffe, 117 Tower Hamlets Road, Forest Gate, to recover the sum of 30*l.* as damages for personal injuries sustained through the negligence of the foreman of the defendants, Fenchurch Street. Mr. Chester Jones appeared for the plaintiff and Mr. Lithiby for the defendants. The plaintiff's case was that he was in the service of the defendants and was working on a building at Forest Gate. When employed on a scaffold (the boards of which were, owing to the defendants' foreman's negligence, too far apart) he fell and caught his hand on a chisel, cutting it so badly that five stitches had to be put into it. He was unable to work for some weeks and he asked for compensation. The defendants' case was that the plaintiff ought to have seen that the scaffold was not wide enough and pushed the boards together. There was no negligence on the defendants' foreman's part and therefore no liability rested on the defendants. The jury found for the plaintiff and assessed the damages at 12*l.*

PITMAN'S Metropolitan School having altogether outgrown its old quarters in Chancery Lane, a new and commodious building has been erected for it at the Russell Square corner of Southampton Row. The new building has a frontage of 67 feet and a depth of 110 feet. It contains seven floors and a basement. The front is of red brick with Portland stone facings, and the principal entrance faces into Southampton Row. The building will be illuminated with the electric light, and heated and ventilated on a new American plan. The basement will contain the cloak-rooms and lavatory, one-half of the space being devoted to the ladies and the other half to the gentlemen. Communicating with the main corridor in the basement are two lifts to convey the students to classrooms on the upper floors. The ground floor contains a fine central hall, round which are placed the administrative offices of the schools, the principal and vice-principal's rooms, the secretary's office, the situation bureau, waiting rooms, &c. On the far side are situated a number of well-lighted classrooms for the male senior and junior shorthand sections, whilst the whole of the first floor is occupied by the speed shorthand practice rooms. Above this, again, are the ladies' shorthand department and the booking and business training instruction rooms. The third floor is devoted to the typewriting branch, whilst the fourth and fifth are given

up to the class for Civil Service preparation and the study of foreign languages. The class-rooms are large, light and airy, and will accommodate 1,500 pupils. The architect of the building is Mr. G. D. Martin, of 3 Pall Mall East, who drew up the plans under the direction of Mr. Ernest Pitman. The contract for the erection of the school is in the hands of Messrs. Perry & Co., the total cost being estimated at 27,000*l*.

AMERICAN NOTES.

A DIFFICULT feat was recently accomplished at Manchester, N.Y., in the moving of a brick chimney nearly 1,000 feet without injury. The chimney is 85 feet high with double 8-inch brick walls 3 or 4 inches apart, and nominally bonded together by three or four bricks on each side every 8 or 10 feet in height. The chimney is 7 feet square outside at the base, tapers slightly and is estimated to weigh about 200,000 pounds. Holes were cut through the lower part of the chimney from side to side and through them large square horizontal timbers were inserted to project 8 or 10 feet on each side. On top of these timbers other large horizontal timbers of the same length were laid at right angles to the first, one on each side of the chimney, close to the wall. A double rectangular cross-platform was thus formed, the ends of the pairs of beams were connected by cross-timbers and from each of these a pair of inclined braces were put up and secured to a timber collar encircling the chimney about 12 or 14 feet above the bottom timbers. This framework constituted a cradle that practically extended the base of the chimney to a diameter of over 20 feet. Cross-beams were placed under the lower sills of the cradle and supported on timber shoes, which were planed on the bottom and greased to slide on skids 50 feet long, from which the whole weight of the chimney was supported after the remaining lower brickwork had been cut away. The skids were supported on ordinary timber-crib blocking, as much as 5½ feet high in some places where the ground was very rough. Grades of 3½ feet ascending and 5 feet (per 100) descending were encountered and safely overcome. The chimney was moved by a single horse working a 30-gear capstan that operated a 5-part (¾-inch) chain tackle. The chimney was revolved 90 degrees about its vertical axis and was loaded, moved and set on its new foundation in nine days by six men. Messrs. W. H. & C. P. Topping, Bridgehampton, N.Y., were the contractors.

THE Department of Public Works of New York City is about to carry out a test of the preserving qualities of various kinds of paint which will be of the greatest interest to all engineers and builders, and should provide them with some much-needed data. The experiments are to be made on a massive steel viaduct which carries One Hundred and Fifty-fifth Street across the elevated tracks of the Manhattan Railway Company. The test is to be carried out in a thoroughly scientific and practical manner, and great care will be taken to shut out any disturbing element which might affect the value of the results. A tight board roof will be built beneath the viaduct to shield it from the smoke of the locomotives. The first operation will be to clean off all the old paint and rust by means of the sand-blast, and this will be done until the surface of the metal presents a clean and bright appearance. The paint will be put on within three hours from the time the cleaning is finished. The various manufacturers will be invited to tender bids and provide specimens of their paints, and these samples will be used in painting the structure. The precautions which are being taken will insure that the different varieties of paints will have the same opportunities to show their good qualities, and the results will be watched with close attention by those who are responsible for the erection and preservation of all classes of structural steel and ironwork.

THE LIVERPOOL ENGINEERING SOCIETY IN MANCHESTER.

THE members of the Liverpool Engineering Society on June 26 were invited to visit the Manchester Cold Storage Works. A goodly number responded to the invitation, and arrived at the Exchange station from Lime Street at noon. Here carriages were in waiting, and under the guidance of Mr. M. C. Bannister the party was driven to the stores, and, after a thorough inspection, entertained at luncheon at one of the leading city restaurants. In the unavoidable absence of the president and vice-president of the Society, Mr. W. G. Mills, a past president, occupied the chair. Mr. Morgan, the oldest member of the Liverpool Society of Engineers, expressed his thanks to Mr. Bannister for what he had done for them that day, and also in Liverpool in connection with cold air stores. It was gratifying to know that there was now no rivalry between the two cities, and that such cordial relations existed between them.

SOHO COWL AND VENTILATOR (NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to any one suffering from smoky chimneys."
"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."
"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

BORDIGHERA AND SAN REMO.

IN his last report Mr. Vice-Consul Daly says:—Speaking generally 1896 may be regarded as having been a year of prosperity for Bordighera. The foreign visitors, upon whom the wealth of the place mainly depends, were more numerous than ever. In May the works in connection with a regular water supply were completed. The supply appears ample, and the water is of good quality.

During the year an English firm of electrical engineers secured concessions for lighting Ventimiglia and Bordighera by electricity, and both those communes now have the electric light. The concession for Bordighera is only applicable to house lighting, as the municipality has an unexpired contract with the Tuscan Gas Company for street lighting. Incandescent lamps of 8-candle power are charged 20 lire a year, or the light is supplied by meter at the rate of 1.25 lire per Board of Trade unit. The engineers above referred to have also obtained powers for the establishment of a system of electric tramways, and it is hoped the scheme will have been carried out before the end of 1897.

The railway in course of construction from Turin to the Mediterranean Coast *via* the Col di Tenda has progressed but little during the past year. Considerable engineering difficulties have been encountered, the tunnel having entered, at its northern end, enormous subterranean reservoirs, which necessitated the construction of canals.

The English electrical engineers who obtained a concession for electric lighting surprised me by stating that, except to a small extent, it did not suit them to obtain their plant from England—not because of slight extra expense, English electrical machinery being superior to that of continental manufacture, but because English manufacturers have no branches in Northern Italy, whereas at Turin and Milan branches are to be found of Belgian, German, or Swiss firms, where every information could be found and prompt delivery of goods guaranteed.

Mr. Vice-Consul Congreve, in his report on San Remo, writes:—

The year was dull and uneventful. Foreign visitors, both English and German, again showed a decrease both in number and in duration of stay.

This is by some people attributable to the dearness of San Remo compared with its French neighbours and competitors, Cannes, Nice and Mentone, and by others to the now prevailing

fashion of going further abroad, to Egypt, India, the Canary Islands, &c. The expensiveness of the place must be to some extent admitted. Villas have not increased in price during the last twenty years, rather the reverse, but wages are high and, owing to heavy duties, many articles of consumption are dearer here than in France.

Hotels are costly, but they are good, furnished with lifts, electric lights and other improvements, and considering the shortness of the season, it would hardly be possible to keep them open on their present scale with lower tariffs.

Still, though for the moment the current tends to other parts, I think it will return. The opening up of new resorts on the French Riviera, such as Beaulieu, St. Raphael and Valescure, has, no doubt, made some difference of late, the other side of the frontier having the advantage of sparing trouble and delay at Ventimiglia; still, the liberty enjoyed by foreign residents in Italy contrasts very favourably with restrictions in France.

The chief work of importance has been the installation of the electric light by a co-operative society with a capital of 100,000 lire, in shares of 100 lire each, the holders being chiefly hotel-keepers and English and other foreign owners of villas. 2,000 lamps have already been set up. The work has been confided to the Aliotti Company, of Basle, some of the machinery being supplied by the firm of Tosi, of Legnano. The town itself is still lighted by gas, the municipality being bound by a contract with the Tuscan Gas Company.

PLUMBERS' REGISTRATION BILL.

THE London Polytechnic Council, consisting of representatives of the City Parochial Foundation, the City and Guilds of London Institute and the Technical Education Board of the London County Council, has unanimously passed a resolution declaring that the objects of the proposed Bill for the registration of plumbers command support, but that the measure requires considerable amendment, including the substitution of some more representative body for the Plumbers' Company to carry out the objects of the Bill. The executive committee of the National Association for the Promotion of Technical and Secondary Education has unanimously adopted a resolution generally approving the principle of registration, and expressing the desirability that the General Council under the Bill should be required to place on the register workmen who have passed

the examination of competent public authorities approved by the Local Government Board, and that the executive body to carry out the Act should be a committee of members of the General Council.

ST. LUKE'S CHURCH, FORMBY.

ON Tuesday last the Bishop of Liverpool consecrated additions to the structure of St. Luke's Church, Formby, which make the building a complete edifice, suitable for the requirements of the parish. Erected in 1852 "in remembrance of the intention of the late Miles Formby, M.A.," the church was an incomplete building, consisting of a nave only. A chancel and transepts have now been added, thus forming a handsome church, which will be a credit to the diocese. The church stands on the site of a Mediaeval church which has long passed away, but of which some interesting archaeological remains still exist, and many old stones lying about the site belonged to the old church, including the old font, and have been collected by Mr. Jonathan Formby, barrister, and now form a pretty feature grouped together at the west end of the church. The additions have been made to give accommodation for the vestry, organ, choir and communion, all of which were formerly in the nave. The new chancel has carved oak stalls and vicar's reading-desk, with stained-glass windows by Mr. Rowlands, of Slater Street, Liverpool, the subject being "Christ Stilling the Tempest," a subject very appropriate, considering the centuries this site has bordered the tempestuous storms of the Atlantic. In the carved oak reredos immediately under this window the texts are added, "He maketh the storm a calm, so that the waves thereof are still," and "Come unto Me, all ye that labour and are heavy laden, and I will give you rest." The south transept is for the purposes of the organ and a vestry for the choir. The organ has been considerably improved by Messrs. Hardy, of Stockport, and the front effectually decorated by Mr. James Smith, of Wavertree. The northern transept is devoted to vestry purposes for the vicar. To complete the improvements the congregation have provided for the renovation of the old portion of the church, including the restoration of the west wall, which had seriously suffered from the severe weather of this stormy coast. A new window has been added to this end, and improved ventilation provided for the church. The architectural work has been entrusted to Mr. Wm. Parslow, the sole contractor being Councillor James

Taylor, of Blundellsands. The masonry has been carried out by his brother, Mr. T. Taylor; Messrs. Paterson & Sons, of Liverpool, have executed the joiners' work; Messrs. Clark & Taylor, the plumbing and decorations; Mr. Littleton, the slating and plastering; and the heating of the church has been carried out by Messrs. J. R. Cooper & Sons, of Liverpool.

The cost of the additions of chancel and vestries amounts to about 1,230*l.*, and the renovating and decorating of the west end will be covered by an expenditure of about 200*l.*

IRON AND STEEL INSTITUTE.

THE autumn meeting of the members of the Institute will be held at Cardiff on Tuesday, August 3, and three following days, and, from the detailed programme just issued, it promises to be very successful. The popular president (Mr. Edward Martin, the manager of the Great South Wales Dowlais Ironworks) will be supported by a local reception committee, consisting of the Marquis of Bute, Lord Windsor, Sir William Lewis and others, who have provided entertainments for the members, among whom will be some of the most distinguished continental and American metallurgists. As becomes a great exporting centre, prominence is given to improvements in the loading and unloading of ships, Sir William Lewis reading a paper on "Improvements in Shipping Appliances in the Bristol Channel," Mr. Thomas Wrightson on the new application of travelling belts in the shipment of coal, and Mr. Harry Riches on some mechanical appliances at Penarth Docks. Among the other contributors of a more technical character are Mr. De Beauneville (Philadelphia), Mr. E. D. Campbell (Michigan), Professor Pouthière (Louvain), Mr. Sainter (Wigan), Mr. Hammond (Penarth).

THE TALLA RESERVOIR.

MESSRS. JAMES YOUNG & SONS, since they got the contract, have lost no time in making a start upon the important works of the Talla Reservoir. Already about 250 men are on the ground, and there will be another hundred or so in a few weeks as soon as hut accommodation can be provided for them. The contractors are now engaged upon the construction of the

 PRICE LIST AND ESTIMATES ON APPLICATION.

huts They are being built of wood, with a felt roofing, upon the south side of the stream below the reservoir. Each is 112 feet in length by 24 feet in width, and accommodates eighty men. They are divided into two halves, with the hutkeeper's house in the centre—an official who is responsible to the contractors for the keeping of the apartments clean and tidy. Kitchens with hot plates have also been erected, in which the men can cook their food and get hot water for their tea. On the north side there is in course of building a bakery, stables, offices for the clerks and engineers, and wooden cottages for the managers and inspectors. The huts are on a sunny slope, which will be kept dry by the railway cutting some distance further up the hill side. In the same vicinity there will be a small church erected, and also the club-house and recreation hall, to which the men are looking forward with interest, as at present there is no place in which they can pass their time after work except in the open air. The men are chiefly engaged in excavating for the puddle trench, which will go 70 feet below the bed of the stream, and is 22 feet in width. To enable them to get down with safety and without any risk of flooding, the contractors are pushing on the construction of a tunnel on the south side of the stream, into which, when it is completed, the whole body of the water will be turned. The inlet will be about 150 yards up from the puddle trench, and the outlet will be below the tail of the embankment. Other men are engaged in stripping off the vegetation and upper soil from what will be the bottom of the reservoir; and with labourers moving about in orderly lines with wheelbarrows, others digging in the earth, and railway trucks constantly in motion tipping the soil which is to go to form the embankment, the valley presents, even at the beginning of operations, a very animated appearance.

NEW PAROCHIAL HALL FOR DARLINGTON.

THE foundation-stone of the new Parochial Hall in connection with the parish of St. Cuthbert's, Darlington, was laid by Mrs. Mortimer, wife of the vicar of Darlington, on the 16th ult. The new hall is an oblong building, two storeys in height, with frontage to Victoria Road. In the basement there are a classroom, covered cloister, heating chamber, &c. The hall is on the upper floor, and can be divided into three classrooms by means of patent swivel sliding partitions, one of the classrooms being raised so as to form a platform. There are two entrances and

lobbies from Victoria Road, one for the general body of the hall, and one for front seats and platform. A small ante-room is provided off the platform. Over the rear of the hall there is a small gallery, reached by an open staircase, which also gives access to the basement classroom. At the rear of the building there is ground space for the use of a quoit club or for drilling purposes. The building will be erected with ordinary clamp kiln bricks, relieved by terra-cotta dressings. The roof will be covered with red Staffordshire tiles, and finished with pointed spirelet, which encloses the air-pump ventilator. The main hall will have stained wood panelled dado. The heating will be by open fireplaces and hot water. The contracts for the work have been let to Messrs. R. Kitching & Son, T. Metcalf, R. Smith, J. & G. Wharton, and J. Robinson & Son, all of Darlington. The architects are Messrs. Clark & Moscrop, F.R.I.B.A., of Darlington.

A BUILDING LAND SALE.

ON Monday last ninety-four plots of freehold building land, forming part of the Tankerton Estate, Whitstable, were offered for sale by auction, the auctioneer being Mr. F. G. Wheatley. A large party of intending buyers and others was conveyed down to Whitstable by special train from Holborn Viaduct (L. C. and D. Ry.), and on arrival at the estate there was served a very substantial luncheon, to which full justice was done. After the toast of "The Queen" had been proposed and duly honoured, Mr. Wheatley said that this was the fifty-second sale which he had held on the Tankerton Estate, and after dilating upon the many advantages appertaining thereto, as well as the favourable terms offered to buyers, he proceeded to offer the several lots in succession, and the prices realised were from 26l. to 27l. each for land in Herne Bay Road with a frontage of 30 feet; 18l. for a plot of 24-feet frontage in Ellis Road, and 20l. for 25-feet frontages in Queen's Road. The two fine plots with a frontage of 60 feet in Tower Gardens went for 200l. each, and shop plots in Pier Avenue, with a frontage of 20 feet, realised 25l. 10s. each; while other plots in Wynn Road, with a frontage of 18 feet, were sold for 16l. each, but in Tankerton Road a plot of the same frontage was sold for 27l.

Among the company present on the occasion was Mr. Wilkinson, secretary of the Tankerton Estates, Limited, and Mr. Petter the accountant.

THE LIBERATOR ESTATES.

MORE than ordinary interest attaches to the several estates forming part of the assets of the ill-fated Liberator Building Society, which are announced for sale by Messrs. Douglas, Young & Co., at Winchester House, on Wednesday next, the 7th inst. The most important of these is the Gidea Hall Estate at Romford, comprising the fine old mansion (with whose name is associated one of the most learned and gifted families of a past era) and six modern detached houses, besides nearly 500 acres of freehold land, with which is included the Manor, or reputed Manor, of Gidea Hall, with the rights and appurtenances. Then there is the Clapham Park Estate, comprising over 43 acres of building land, besides three mansions known respectively as Lincoln House, Clarence House and the Woodlands. Next comes the Chingford Rise Estate, adjoining Chingford Railway Station, which comprises twenty-seven detached and semi-detached villas, besides nearly 100 acres of building land, with a total frontage of over 20,000 feet. In addition there is the Norbury Park Estate, on the main road to Croydon, adjoining Norbury Station (L. B. and S. C. Railway), comprising 68 acres of freehold building land, which will afford sites, it is computed, for about 300 residences. And lastly, there is the Tilbury Docks Estate, comprising 310 freehold and 39 leasehold houses and shops, besides 26 acres of freehold building land, for the most part laid out with roads formed ready for building.

BATTERSEA PARK EMBANKMENT.

A PROPOSAL will shortly come before the London County Council for the construction of a suitable embankment along the whole river frontage of Battersea Park. The existing river wall is of a very slight nature, and a large proportion of it is in an extremely bad condition. The parks and open spaces committee of the Council, who are making the present proposal, state that the present wall may be described as a mere skin of concrete blocks, generally 9 inches in thickness and in some cases less. For some years past it has been the practice to patch the worst places from time to time at an annual outlay of some 400*l.* or 500*l.* The result, however, has not been satisfactory, and the deterioration which has arisen in past years has not been overtaken, so that the wall is steadily growing worse.

The Council's engineer reported in 1895 that the cost of putting the wall in a proper state of repair, if undertaken at that time, would be about 6,000*l.*, and that even then there would be a subsequent annual charge of about 200*l.* for its maintenance. Under these circumstances the committee are firmly of opinion that the best and most economical course would be to reconstruct the wall in a substantial manner. The length of the river front of the park is about 1,300 yards, or about $\frac{3}{4}$ of a mile, and the engineer is of opinion that a granite-faced wall with a granite parapet can be constructed there for the sum of 43,500*l.* In view of the large recurring charge for maintaining the existing wall and of the economy that would ultimately be effected by the substitution for it of a permanent granite embankment, and also taking into account the enhancement of the appearance of the park, the committee strongly recommend the Council to adopt their scheme. It is proposed that the cost of the improvement shall be charged to capital account, the repayment being spread over the full term of the stock, out of the proceeds of the issue of which the cost would be defrayed.

BARS IN LONDON STREETS.

IN furtherance of their desire to remove the remaining bars and gates which obstruct the street traffic of London, the highways committee of the London County Council have been considering what course they should pursue. In a report which they will shortly present to the Council they state that they have had before them a list, compiled from information received from the various vestries and district boards, of existing obstructions to the free use of streets and places in London. By far the largest proportion of the 217 places specified in the list were blind turnings, and as the opening up of those, even if deemed advisable, would involve the removal of buildings, they do not think the Council should take any action in regard to them. From a report by the engineer of the result of an inspection made under their instructions as to other places mentioned in the list, it appeared—(a) That at nine places the obstructions could be removed, but that no great advantage would ensue; (b) that at seven places the obstructions might be removed for strictly local considerations, and in the opinion of the committee the matter could be left to the respective local authorities to deal with; (c) that at nine places the removal of the obstructions would, owing to various causes, be inadvisable.

and might prove a source of danger, whilst two of the places obstructed were adapted and used for foot traffic only. The committee therefore, upon full consideration of the circumstances, have come to the conclusion that as regards six places only it is expedient that powers should be sought by the Council for the removal of the obstruction. They accordingly recommend that powers should be sought in the next Session of Parliament for the removal of the bar in Brunswick Square, Camberwell, the toll-gate in College Road, Camberwell, the gate in Duncan Terrace, Islington, the gate in Nelson Square, Blackfriars Road, the gates in Montague Place, Tooley Street, and the walls in Cæsar Street, Shoreditch.

THE WESTERN AUSTRALIAN CASKET.

THE casket which is to contain the address to Her Majesty the Queen from the Houses of Parliament of Western Australia on the occasion of the Jubilee celebrations has arrived in London, and will be on view for a few days at Messrs. Gillow & Co.'s premises. The address was designed and illuminated by Mr. A. G. Stach, of the Engineering Surveys branch of the Public Works Department. The illumination takes the form of floral designs, the subjects being the wild flowers of the colony.

The base of the casket is formed of a slab of kauri, highly polished and inlaid on the top with pear wood, having an enriched border of jarrah. The inscription plate attached to the base is in the form of a gold shield and is engraved as follows:—"From the Parliament of the colony of Western Australia to Her Majesty Victoria, Queen and Empress, in commemoration of her reign of sixty years. 1897." The supports of the casket itself are large blocks of rich quartz in the rough, containing altogether about 40 ounces of gold. On these rich quartz supports rest, amongst silver rushes, four swans, sitting diagonally to the square lines of the casket, with conventionally enriched wings, carried on by an enriched curving leaf covering the angles of the box. The swans are of large size, and are of cast copper and tin alloy.

The lower portion of the body of the casket which rests between the upstretched wings of the swans is of highly-polished jamwood, so called from the curious odour of raspberry jam attaching to it, and the upper portion is of figured banksia wood, carved with flutes, and topped with a border of curly jarrah under the closing line of the lid, the line itself being

guarded by a narrow-chased gold ribbon. The jamwood lower portion is covered with gold latticing up to about the central half height of the box, and around the lower margin runs a copper ribbon with small gold nuggets inserted at short intervals throughout.

On the front face of the casket is a large chased gold plate surrounded by foliated gold fretwork, forming a rich panel, enclosing three pearl-shell medallions, on the centre shield-shaped one of which is engraved a view of the pearl-fishing industry, those on either side of circular form depicting scenes of the agricultural and pastoral industries. On the reverse side a corresponding gold plate and panel encloses three other pearl-shell medallions, the central one depicting a timber-cutting scene in the forests, while those on either side represent scenes illustrating viticulture and mining.

In the centre of the front is the lock, framed in a gold plate surrounded with the monogram V.R.I., and surmounted with a gold crown mounted on its four ribs with pearls. The key is of solid gold, handsomely mounted and handled. The handles at each side have copper fastenings and are themselves of jamwood, with gold mountings. The woodwork of the lid is mainly composed of jarrah carved in nilling in bold relief, the border round the closing edge being of sandalwood enriched with carvings of the curious nuts of the banksia. The centre portion of the top is an oval panel of polished pear wood, enclosed by an enriched border of carved sandal wood. On the front face of the lid, over the lock, are mounted the Royal arms, and on the reverse face the arms of Australia, both richly embossed in pure gold, with the shields and quarterings in enamel. Round the closing line of the lid runs a copper ribbon with nuggets similar to that at the bottom of the body.

On the top of the casket is mounted, on gold supporting claws, a large and very rich specimen of white quartz, with coarse gold showing all over and through and underneath, having also attached to it an exceedingly rich smaller specimen showing crystals of both gold and quartz. These specimens contain altogether over 20 ozs. of gold, and are surmounted by a small golden emu. The inside of the box and lid is lined with corded blue silk, on which will be laid the illuminated address.

The value of the casket is about 500*l.*, a very large proportion of which is represented by the very rich quartz specimens in the supports and on the top, and the nuggets in the borderings; while the gold inscription plate, the embossed Royal and Australian arms, the gold panels in the front and

back, the pearls on the crown over the lock, and the goldsmith's work in the general enrichments are responsible for most of the remainder, the intrinsic value of the box itself being but small.

The whole of the woods named in the above description are those of the colony, and much care has been taken to obtain thoroughly seasoned and representative blocks of them from which to cut out the portions for the various parts of the box. The copper and tin from which the swans are cast represent the copper mines at Northampton, in the neighbourhood of Geraldton, and the tin-fields in the south-west and north-west portions of the colony. The pearl-shell medallions in the front and back gold panels, and the pearls on the crown over the lock come from the pearl-fields of the north-west. The gold used throughout is from the various rich fields of the colony, including Kimberley, Pilbarra, Murchison, Lawlers, Menzies and neighbourhood, Kalgoorlie, Coolgardie and Dundas. The rich quartz specimens forming the supports of the casket came from the Mainland Consols, Lake Austin, on the Murchison gold-field, and the beautiful white and crystal quartz specimens surmounting the whole casket from the Welcome mine, near Mount Magnet.

The casket was generally designed and its construction superintended by Mr. E. H. Hamilton, of the Architectural Division of the Public Works Department, assisted by suggestions from Mr. H. C. Prinsep, Under-Secretary for Mines, Mr. H. W. Gibbs, of the Lands and Survey Department, and several other officers of the public service, whose artistic faculties and attainments were called upon. Mr. Prinsep kindly took upon himself, aided by the Minister of Mines, to procure the rich quartz specimens.

The woodwork of the box was framed and carved locally, under Mr. Hamilton's direction, chiefly by Messrs. Cohen & Madeley. The goldsmith's work was entrusted to Mr. Jerger, who from the first has given unwearied energy and talent to its artistic completion with very excellent results, well aided by Messrs. Donovan & Overland in the manufacturing goldsmith's work, and by special workmen, fortunately obtained by Mr. Jerger at the right moment. The heavy gold work throughout has been very artistically finished, especially considering the very short time available, His Excellency the Governor, after a closely critical examination, expressing the opinion that the workmanship would compare not unfavourably with that of English firms. The embossing work in the Royal and Australian arms is especially fine, while the rich gold panel-plates in the back and front of the casket are also very fine productions of

the goldsmith's art. The engravings of the various scenes illustrative of the principal industries of the colony upon the six pearl-shell medallions has been very finely and artistically executed. The whole of the work of and in the casket has been carried out in Perth, and it is a genuine product of the colony, both in materials and workmanship, throughout, and should hold its own well among the very numerous presents which will be made to Her Majesty from all parts of the empire in commemoration of the record reign.

SHOREDITCH ELECTRIC LIGHTING.

ON Monday the new system of electric lighting adopted by the Shoreditch Vestry was inaugurated by Lord Kelvin. His lordship said that it was worthy of the Victorian era as an example of the combination of scientific forethought, mechanical skill and courage, which had nothing of gambling in it, but simply brought into practice recognised engineering possibilities. Shoreditch might be proud of what she had done. Dust destructors had been tried for some years in order to get quit of refuse at a lower cost than was required for spreading it on the ground or carrying it out to sea, but little had been done in the way of using the heat of these dust crematories for raising steam. Shoreditch was the pioneer vestry in this respect. But this was only the small beginning of what would be a much greater thing. All the dust would soon be used in this way, and neighbouring vestries might come to Shoreditch and offer 2s. a ton if it would take their refuse and make light and power from it. Corporations were now waking up to the possible prospect of using electricity for the transmission of power, and it was almost certain that in Shoreditch, which possessed the centre of gravity of the cabinet-making industry, electric motors would be substituted for gas engines, and much of the work would be done by energy obtained from dust and transmitted by electricity. With regard to electric light, at the price at which the vestry were going to supply it, he believed it would be less costly than gas at 2s. 10d. a thousand feet, and he would advise all the people of Shoreditch to give it a trial.

About five years ago the vestry obtained a provisional order for the supply of electricity, and then the idea was conceived of combining the destruction of household refuse with the production of electric energy—in other words, of utilising the heat liberated by the burning of the dust for raising steam with

**A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.**

This magnificent illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

which to drive electric machinery. The practicability of the proposal having been favourably reported on by the experts consulted, the vestry proceeded to look for a site upon which to erect the necessary plant. A good deal of delay was caused by the difficulty of finding one at a moderate price. At length, however, one was obtained in Pitfield Street, which, with additional purchases in Coronet Street, was large enough to accommodate not only the dust-destructors and electric-lighting station, but also public baths and washhouses and the free library. Discussion of details between the various bodies concerned caused further delays, with the result that the electric-lighting station is only now in working order.

The main interest of the installation lies in the fact that the dust is being burnt to raise steam. Dust destructors are common enough, but their heat has not hitherto been utilised on any considerable scale. In the present case there are twelve destructor cells, each having a grate area of 25 square feet and heating six water-tube boilers working at a pressure of 200 lbs. to the square inch. The chimney is 150 feet high and 7 feet in internal diameter at the top, and in addition there are three electrically-driven fans, which each deliver 8,000 cubic feet of air a minute with a maximum ash-pit pressure of 3 inches of water. An interesting feature is the employment of Mr. Druitt Halpin's system of feed thermal storage. As it is necessary to keep the destructors burning continuously, steam is generated during all the twenty-four hours. But as power is required on a large scale during only a portion of that time, in order to reduce waste a plan of heat storage has been introduced, by which during the day steam is mixed in a vessel with cold water in such proportions that at evening the cylinder is full of water at the temperature and pressure of the steam required by the engines. The boilers are fed with this heated water and are said to be enabled in consequence to produce one-third more steam than they would if working with water direct from the mains. As to the amount of refuse consumed it is expected that the most efficient rate will be between eight and twelve tons a day. The electrical plant at present consists of three generators working at 1,100 volts, and three low-tension dynamos at 165 volts. All are driven by Willans's three-crank engines, coupled direct. The current supplied is continuous, the choice being determined by the large employment of electric motors that is anticipated in the district, and the distribution is on the continuous current motor transformer (Oxford) system. At present the vestry pays 3s. 2d. a ton for the disposal of its refuse, and it calculates that by burning it it

will save about 2s. a ton. In consequence it is prepared to supply electricity at 6d. a unit for the first two hours and 4d. an hour afterwards, while during the hours of daylight the price charged will be 2d. a unit. A contract has been concluded with a syndicate which will supply electricity at 6d. per unit at all hours by means of the penny-in-the-slot system, and will also supply fittings free of charge to the consumer; while another syndicate will supply free fittings to consumers who are ready to pay 4d. per unit more than the vestry's actual charges. Orders have already been received to nearly the full capacity of the present plant.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

14360. John Gunnings, for "Holder for stair-rods, curtain-rods and the like."

14378. Eliah Box, for "Improved mode of securing pipes in sockets."

14388. Karl Dams, for "Improved couch for use in connection with steam baths."

14414. Jabez Barnes, for "An improvement in cornice-pole ends."

14419. Robert Catton and Samuel Gater, for "Improved construction of sliding window-sashes."

14431. Edmund Charles Herne, for "Improvements in sash-fasteners."

14515. Henry Harris Lake, for "Improvements in apparatus for heating buildings and structures."

14600. Harold John Richardson, for "Improvements in ventilators."

14616. Thomas Clifford Nixon, for "An improved pipe-coupling."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from 1/4th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.,

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

DO YOU KNOW THE ADVANTAGES OF SANDERSON'S PATENT CAMERA?

FOR ARCHITECTURAL PURPOSES.

IF NOT, READ THE
You will then learn of what im-
It saves time,

SUCCESS. Without Trouble.

FIG. 2.—Taken with Sanderson's Camera, with a reserve of rising front in hand.

FIG. 3.—Taken with ordinary camera after straining movements to the utmost.

TOWER & GATEWAY, CHRIST COLLEGE, CAMBRIDGE.

Taken under Test conditions. A difficult subject, owing to its height and narrowness of the street.

Fig. 2 was taken with SANDERSON'S PATENT CAMERA, the Tripod remaining perfectly level, there being no necessity to tilt it, as is usual with other cameras. No difficulty was experienced in properly composing the subject owing to the great range of the Patent Rising and Swing Front, which reduces the adjustments to a minimum, and does away with the necessity of the orthodox Swing Back.

To accomplish the above it was necessary to raise the lens (a 6 in. Zeiss on a 10x8 plate) above its covering power, but by bringing SANDERSON'S PATENT SWING FRONT into play, which enables the axis of the lens to be directed to the bottom of the plate, perfect covering power and illumination was immediately obtained, as in Fig. 2.

Fig. 3 represents the best possible result that could be obtained with the same lens on a first-class modern camera, furnished with the usual Swing Back, Rising and Swing Front, &c., these movements having been strained to their utmost limits, and the Tripod tilted to a dangerous degree.

FOLLOWING TEST.
mense value one would be to you.
temper, and plates.

FAILURE. With all the old Troubles.

FIG. 3.—Taken with ordinary camera after straining movements to the utmost.

The above results point to the perfection of SANDERSON'S PATENT CAMERA for work of this description more forcibly than any arguments for or against its principles.

A Descriptive Pamphlet may be obtained on application to the Sole Licensees and Manufacturers—

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied some more of their patent Manchester stoves to the Lunatic Asylum, Ballinasloe, those previously supplied having proved very satisfactory.

A VERY handsome five-light window, illustrative of scenes from the Old and New Testaments, has just been erected in Clifton Church, near Tamworth. The five lights show the Birth, Baptism, Crucifixion, Resurrection and Ascension of Our Saviour, and in the tracery above are pictures of subjects from the Old Testament. The work was entrusted to Messrs. Jones & Willis, of Birmingham and London.

MESSRS. FREDERIC WHITFIELD & Co., of Birmingham, have just completed an important strong room, which has been made for erection in a mansion. Its size is 8 feet 6 inches high by 7 feet 6 inches wide by 17 feet 6 inches long. The whole of the outer walls are constructed of two wrought-iron plates, intersected with specially hardened drill-proof steel between, riveted and screwed together and strengthened with massive joint and angle bars. The whole of the interior is lined with 4-inch chambers, containing the best-known steam-generating

ESTIMATES
GIVEN

"Amongst the showrooms of our trade throughout the country, few (if any) excel in spaciousness and dignity those of Messrs. Sparrow & Son, of Nottingham." — *Journal of Decorative Art*, August, 1896.

fire-resisting composition. The opening of this vault is secured by one of Messrs. Whitfield's extra strong bullion vault doors, which is of enormous strength, fitted with lobby and ventilating grille complete. The door is fitted with six massive bolts each at back and front, and two each at top and bottom, the bolt work being secured by three special patent locks, which, we understand, are absolutely unpickable, special provision having been made against the use of explosives. The total weight of this structure is over 28 tons.

VARIETIES.

THE town-hall of Ayr, stated to accommodate 2,000 persons, together with the town-hall organ, were destroyed by fire on the 1st inst. The flames spread to a block of dwelling-houses occupied by firemen and other servants of the Corporation. The damage to the town hall is estimated at from 15,000*l.* to 20,000*l.*

THE Central Ward Liberal Club, Stamford Street, Leeds, was found to be on fire early on the 5th inst., and was completely gutted before the flames were extinguished. The origin of the fire is unknown. Fortunately there was no loss of life and no one was injured.

THE statute labour committee of Glasgow Corporation last week inspected the progress of the work of reconstructing Glasgow Bridge. It was found that of the forty-two large cylinders twenty-one have now been sunk to their full depth, as have also the twelve small cylinders. Three of the larger size are in process of being sunk.

THE Old Bell Hotel, Holborn, the last of the famous galleried coaching-houses in London in which stage plays were performed, and the parlour of which was the meeting place of many of the celebrated wits, poets and *litterateurs* of the past, was put up to auction at the Mart, Tokenhouse Yard, as a building site of 7,200 feet. The highest bidding for the eighty years' lease, with the license, was 11,603*l.*, at which premium price it was sold to Mr. Fitch, the well-known surveyor, of Furnival's Inn. The rent will be a peppercorn for the first year and 750*l.* per annum for seventy-nine years.

A DESTRUCTIVE fire occurred at Kirkcaldy Harbour on Sunday, the 4th inst., resulting in the almost total demolition of the offices and sheds tenanted by the Kirkcaldy, Leith and Glasgow Steam Packet Company, Limited, and the property of

the Kirkcaldy Harbour Commissioners. The dockhead in the neighbourhood of the pinnacle offices was stocked with a large consignment of bales of cork for Messrs. M. B. Nairn & Co., and it was there that the fire originated. It is believed that the fire was caused by a lighted match being thrown amongst the cork by some lads who were sitting on the bales smoking cigarettes.

SOME workmen, while digging in the foundations of an ancient monastery in the Rue de Béarn, Paris, recently discovered two leaden coffins, dated 1630. The coffins contained two skeletons, the skull of one of which was found to be filled with white crystals. This was proved to be the exceedingly rare substance bi-calcinate of phosphorus, which has only once before been found under similar circumstances, namely, in 1807, when an ancient coffin was opened and the skull found to be filled with it. The skull of the second body contained only a few crystals of the same chemical.

THE sewerage committee of Aberdeen Town Council had under consideration last week a new sewerage scheme, estimated to cost 160,000*l.* The burgh surveyor expressed the opinion that so extensive an undertaking would not require to be carried out for some time, but he urged the necessity of at once proceeding with works estimated to cost 75,700*l.* The committee decided to recommend that in the meantime only part of the scheme should be undertaken at a cost of upwards of 40,000*l.* This will mean an additional 1*d.* per 1*l.* on the rate.

THE unfinished temple of the New and Latter House of Israel, at Chatham, otherwise known as Jezreel's Tower, has been offered for sale by auction, the "faithful having been unable to complete the huge structure, or to pay the last instalments due to the builder." The auctioneer described the building as a "very imposing, castle-like crenelated structure, 124 feet square by about 100 feet in height, with an elevated tower at each corner, but minus the central dome, with which it was originally intended to finish it off." Over 40,000*l.* had been spent upon the building, which has a central hall that will seat 5,000 persons, but as the highest bid was 5,500*l.* the lot was withdrawn.

WHILE demolishing part of an old villa in Roseneath Terrace, Edinburgh, to make way for the erection of a tenement, some workmen unearthed a number of skeletons. The find consisted of three skulls and other bones, and it is thought that some more remains were carted away amongst the *débris*. The thinner parts of the bones were largely decayed, but otherwise

LIBERAL DISCOUNTS ACCORDING TO ARRANGEMENTS.

ESTABLISHED OVER HALF A CENTURY.

they were in a good state of preservation, and considering the history of the locality it is believed they are of an early date. The collection was discovered 3 feet underground below the stone floor of a small back-house attached to the dwelling, which was at one time occupied by a minister and more recently by a lawyer.

THE marble group representing Charity which until recently surmounted the drinking fountain at the Royal Exchange, adjacent to Peabody's statue, will shortly be replaced by a bronze replica, which has been successfully cast by Messrs. Hollinshead & Burton at their Thames Ditton foundry.

A DESTRUCTIVE fire occurred on the 7th inst. at Derby, the extensive timber yard of Messrs. Roe & Son being completely gutted. The flames also spread to a large number of the tenement houses in the immediate neighbourhood, the inhabitants being compelled to leave hurriedly. It was estimated that 500 persons had been rendered homeless, their houses having either been destroyed or seriously threatened, and the poor people had to be accommodated for the night in neighbouring schools.

THE formal opening of Port-Henry Harbour, Peterhead, took place on the 5th inst. by the Harbour Trustees' boat *Flying Scud* severing a blue ribbon and entering the harbour with Provost Smith and members of the public bodies on board. The area of the harbour, as additionally excavated, will be nearly six acres, and the work has been carried out by Mr. Nott, the contractor, at a cost of 32,000*l.*, including 12,000*l.* for forming a quay wall in South Bay. The quantity of rock excavated has been 160,000 tons, and the whole has been carried out within a year, all to the satisfaction of the engineer and the trustees.

THE annual exhibition of drawings, needlework, designing in paper and colour, modelling in clay and cardboard, woodwork, cookery, laundrywork and kindergarten executed in the various schools of the School Board for London will be held at the "Hugh Myddelton" School, St. James's Walk, Clerkenwell Green, E.C., from Friday, July 16, to Wednesday, July 21 (Sunday excluded), from 12 o'clock noon to 8.30 P.M. The exhibition will be opened by the Most Hon. the Marquess of Londonderry, K.G. (Chairman of the Board). Practical demonstration lessons in cookery, laundrywork and needlework will be given each day. Admission to the exhibition and demonstration lessons will be entirely free, and it is hoped that the public will largely avail themselves of this opportunity of seeing specimens of the work being done in their schools.

ON July 2 an extensive portion of the chemical works of Messrs. W. R. Earp, Halton Road, Runcorn, fell with a crash. The premises, which were extended some six months ago, consist of five bays. In the two bays which are now in ruins twelve 14-inch girders, measuring 23 feet and weighing a ton each, were introduced, and it is supposed that the pillars upon which these were placed gave way, thus causing the collapse. The works were in full operation at the time, and several men received slight injuries. The reconstruction of the premises will necessitate considerable expenditure, and in addition to this much damage was caused to manufactured and raw material.

In the course of some excavations made by workmen employed in demolishing old buildings in Northgate Street, Chester, the base of a Roman column was uncovered. The relic is the largest specimen of its kind yet found in Chester. It is composed of a square base of red sandstone, which is no doubt Chester rock, the sides being 4 feet 3 inches in length and the height 1 foot 4 inches. Surmounting this is a moulded circular column 2 feet 10 inches in diameter, with a height of 1 foot 8 inches, this of course being the proper proportion. The spot where the discovery was made is just under the foundations of what was known as the Old Lightcake shop, a curious and very ancient little establishment which was some 4 or 5 feet below the level of the street.

A DESTRUCTIVE fire broke out between 4 and 5 A.M. on the 2nd inst. in the extensive premises of Messrs. J. F. & G. Harris, timber merchants, Victoria Wharf Saw Mills, Palmer's Road, Bethnal Green. The fire originated from an unknown cause in a building used as joiners' workshops and soon spread in every direction. At half-past five o'clock the fire was at its height, its progress being watched by a vast concourse of people. At this period of the fire four buildings, used as workshops and saw mills, covering an area measuring about 30 yards by 35 yards, were burning furiously and were eventually destroyed, the flames shooting to a great height. A very large stack of timber in the yard next caught alight and was speedily reduced to ashes. The stables were also involved in the general ruin and a horse was burned to death. Messrs. Harris write to inform us that the fire has destroyed a portion only of their machinery and buildings and has in no way interfered with their stock, and the business will be carried on as usual.

THE widening of Upper Thames Street is now, says the *City Press*, on the point of completion, the last claim having

PRICE LIST AND ESTIMATES ON APPLICATION.

been settled. The work of widening this now much-used thoroughfare was commenced over forty years ago, and bit by bit and house by house the scheme has been carried into effect. The first portion of the improvement having been more or less completed, there remained several projecting properties which marred the street line, and were responsible also for occasional "blocks" in the heavy and increasing traffic which passes along the street all day long. These projecting properties have been acquired by the Commission of Sewers, and in the course of a month Upper Thames Street will have a clear street line from Peter's Hill to Queen Victoria Street, and, in addition, it will be paved with Australian hard wood. The cost of the improvement, from start to finish, has been exceedingly heavy. It is difficult to estimate the amount, but, heavy as it has been, the public-spirited policy of the Commission has been more than justified.

ELECTRIC NOTES.

CONSIDERABLE damage to gas and water pipes by electrolysis, due to the escape of the electric current used to propel trolley cars, has been noted in Brooklyn, U.S.A. An illustration of the action of electricity was shown in a gas pipe 2 feet below the rail, the pipe having been found with a gap an inch wide in it, and the edges eaten down to the thickness of a sheet of paper.

THE installation of the electric light at Onchan, near Douglas, Isle of Man, in celebration of the Queen's long reign, is fast approaching completion, and will be formally opened on the 12th inst. For a consideration of 175% the Isle of Man Tramway Company are placing in the village and lighting, cleaning and repairing free for ever the five powerful lamps necessary.

A FRESH scheme for the electric-lighting of Victoria Embankment and Westminster and Waterloo bridges has been formulated by the highways committee of the County Council. From reports prepared by the Council's engineer and chemist it appears that the substitution of incandescent burners for those at present in use is inadvisable. Exclusive of that which it is not proposed to light, the first cost of the installation on the embankment and bridges is estimated at 22,000%, and the committee recommend that the Council should establish buildings and plant for the purpose on a piece of ground adjacent to Charing Cross Station. It is proposed to set up ninety arc

lamps of the Jandus pattern, fifty-four on the Embankment, ten on Waterloo Bridge and eleven on Westminster Bridge and its approaches. The cost of maintenance, assuming that half the lamps are extinguished at midnight, will be 1,900% a year, but this will be increased to about 2,700% by capital charges and rates and taxes. The cost of the present system is about 1,300%, including repairs, but exclusive of capital charges of any kind.

THE departmental committee on dangerous trades has issued an interim report upon the dangers connected with electrical generating works. The risks attendant upon these are described at some length. The peculiar danger is the liability to shock, which is often fatal if, by accident, anyone comes into contact with the conductors when charged to a high pressure. The contact need neither be very perfect nor direct; provided two parts of the body are made to touch conducting materials which themselves differ in pressure by 1,000 volts or more, or even by much less if the contact with the flesh is very good, a dangerous—and possibly fatal—shock will result. High-pressure overhead wires, even if insulated over their entire length, can never be considered as entirely free from risk. As illustrating the dangers incidental to the use of electricity it has been stated that, in addition to minor accidents, of which we hear little or nothing, fourteen deaths have been reported since 1892. The committee make a series of recommendations for the furtherance of safety in these works, and suggest that all persons engaged in them shall be instructed in methods of artificial respiration to be applied in case of accidents. They further recommend that a specially qualified person be appointed to advise the Secretary of State or the chief factory inspector on matters requiring technical knowledge of electricity.

BUILDING AND BUILDERS.

THE foundation-stone of a building which is to serve the dual purpose of a technical school and public free library at Hyde was laid on the 3rd inst. The cost is to be about 12,000%.

THE plans committee of the Aberdeen Town Council have sanctioned the erection of new buildings of the total value of 38,000%. These include no fewer than thirty blocks of new dwelling-houses.

THE Mersey Docks and Harbour Board are contemplating considerable improvements at Mann Island. The board own

the warehouses and other property in the locality. The buildings on the island are among the oldest in Liverpool, and not at all adapted for modern business.

At a meeting of the Birmingham baths and parks committee, under the presidency of Councillor Johnson, it was resolved to recommend the City Council to approve the plans for the erection of a new suite of baths at Green Lane, Small Heath, and to authorise the committee to accept tenders and proceed with the work forthwith.

THE foundation-stone of a new ragged school at Blackburn was recently laid by Earl Compton, M.P., president of the Ragged School Union. The building is estimated to cost 2,600*l.*, and is rendered necessary by the structural unfitness of the old premises, where 500 scholars attended daily instruction by thirty-five voluntary teachers.

THE old tower of the parish church of Cadoxton-juxta-Neath is about being restored, under the superintendence of Mr. C. B. Fowler, of Cardiff. The cost is estimated at 300*l.*, and it is proposed to commemorate the Diamond Jubilee by adding three bells, making a peal of six, at an additional cost of 200*l.* The tower is one of much interest, and is in Early Fourteenth Century style. It is proposed to "restore" only the portions which are perished and dangerous, preserving all the sound parts, and keeping the details of the lost features as near as possible to the originals.

PUBLIC WORKS IN SICILY.

THE British Consul at Palermo in his last report writes:—The waterworks are now practically completed, and the supply which is laid on in most of the principal streets is satisfactory and the quality good. The supply of good drinking water throughout the town is a very great boon, and ought to cause a marked improvement in the health of the population. The supply in the past was very far from satisfactory, and was without doubt the cause of much sickness.

A system of drainage throughout the newer parts of the town is now being carried out. This is much needed, the cesspools now in use being most undesirable.

The papers referring to the proposed dry dock and dock-yard have been signed and the plans and specifications drawn up, but no actual steps for commencing the work appear to have been taken.

The Massimo Theatre, referred to in previous reports, is at last completed, and has been opened. It was commenced nearly twenty-five years ago, and is said to have cost about 400,000*l.*

The other proposed important work in other parts of the island of Sicily are:—Proposed water-supply for the town of Girgenti, for which tenders were invited in December last. The supply is to be drawn from the sources of the Poltano, a distance of 23 miles from the city, at an elevation of 1,650 feet above the sea. The terms are that the contractor shall, on completion and approval of the works, receive the sum of 350,000 lire, and have the profits from the sale of water for a term of sixty years, the municipality having the right to 500 cubic metres of water a day for the public service.

Girgenti, which has a population of about 25,000, is situated about 4 miles from the sea, on the south coast of the island, the elevation being about 1,080 feet above sea-level.

A more important affair is the proposed formation of a harbour at Licata. The promoters claim that the harbour will, when constructed, draw most of the mail steamer traffic for Australia and the East away from the other European ports such as Marseilles, Naples and Brindisi, it being in the most direct line between the Straits of Gibraltar and Port Said. Very different opinions are expressed here as to the probable success of the scheme, and capitalists and others should make full inquiries before investing.

NORWEGIAN TENDERS.

THE Secretary of State for Foreign Affairs has received despatches from Her Majesty's consul-general at Christiania reporting that tenders are invited for the following:—By the Norwegian State Railways Administration, for the delivery of seventy-five narrow-gauge open trucks, the delivery of 100 covered goods vans, the delivery of 132 tons of stranded galvanised fencing wire, No. 5, and 96,400 iron fencing posts. Tenders for any of the above should be sent in by the 21st inst. By the Christiania Gas Works, for the delivery of cast-iron gas pipes of various sizes, the latest date for sending in tenders for which is the 12th inst. By the Kongsberg Arms Fabrik, for the delivery of 280,000 kilogrammes of steam coals and 1,200 kilogrammes of gas coke, tenders for which must be sent in by the 10th inst. Such further particulars as have been received with regard to these contracts may be seen at the commercial

department of the Foreign Office any day between the hours of 11 A.M. and 6 P.M.

BIRKBECK BUILDING SOCIETY.

THE forty-sixth annual meeting of the Birkbeck Building Society was held at the offices, 29 and 30 Southampton Buildings, Chancery Lane.

The report adopted states that during the financial year just closed the total receipts have reached the large sum of 18,967,010*l.*, exceeding by more than 1,500,000*l.* the total receipts of all the other incorporated and unincorporated building societies in the United Kingdom—numbering 2,625—as shown by the Chief Registrar's return, presented to Parliament on April 23 last.

The receipts from subscriptions have amounted to 240,082*l.*, and from deposits to 14,678,767*l.* The withdrawals have been 13,880,483*l.*, showing a balance over the preceding year of 1,038,366*l.*, or a total increase since 1892 (a period of five years) of 3,438,741*l.*, after allowing for the large amounts withdrawn during the panic in that year. The total liabilities on subscriptions and deposits now exceeds nine millions (9,113,454*l.*).

The balance of assets in excess of liabilities amounts to upwards of four hundred thousand pounds—400,186*l.* 16*s.* 4*d.* The total assets are 9,513,641*l.*

During the past year the sum of 4,317,502*l.* has been invested in the purchase of Government and other stocks, and securities to the amount of 3,625,952*l.* have been disposed of, the difference bringing up the investments in convertible securities and ground rents, including 702,348*l.* cash at bankers, to 8,620,913*l.* Upwards of two millions of these funds—2,158,589*l.*—are inscribed in the books of the Governor and Company of the Bank of England, the amount invested in Consols and other British Government securities being 1,515,353*l.*

The fifteenth triennial bonus has been apportioned this year, in accordance with the rules. The sum, with the bonus previously set aside, but not yet payable, will absorb 61,179*l.* 10*s.* This amount is provisionally credited to all members holding investing shares, but the bonus is only payable providing the instalments have been regularly made, and then not until the shares have been ten years in existence.

A further sum of 25,000*l.* has been added to the Permanent Guarantee Fund, which now stands at 200,000*l.*, the whole amount being invested in Consols.

FIRE AT CHEDDLETON ASYLUM.

AT about half-past one o'clock on Sunday, the 4th inst., a cycle messenger brought the information to the Leek fire station that a fire was raging at the new asylum at Cheddleton (about three miles distant), which is being built by Messrs. Brown & Son, of Salford, for the Staffordshire County Council, at a cost of about 200,000*l.* Owing to various delays, the brigade did not reach the spot until about three o'clock, when the fire had practically done its worst. It seems that at 1.15 Mr. H. T. Pebworth, clerk of the works, heard a sound that he judged to be rain, but there was also a peculiar hissing sound that induced him to get out of bed and look out. He saw at once that the west end of the dining-hall and theatre (a splendidly timbered room 140 feet by 60 feet) was on fire. Rousing the contractors' foremen and other persons in authority, Mr. Pebworth applied the existing fire-extinguishing appliances to save the adjacent buildings, pending the arrival of the engines and brigade from Leek. Half an hour before their arrival the roof fell in, forcing out the east gable and doing considerable damage to several buildings near the spot. How the fire began is a complete mystery. The fire room in which it broke out was nearing completion, and no fire had been in it for several weeks. Breaking out in the west end, with a brisk wind behind it, the progress of the flames was so exceedingly rapid that the building was doomed from the outset. The damage is estimated at 10,000*l.* The asylum has been in course of erection for upwards of two years, and the disaster has rendered nearly 500 men idle for the present.

THE NEW DOCK WORKS AT LEITH.

CONSIDERABLE progress has been made with the erection of the new wet dock at Leith. Since the beginning of the year four or five steam navvies have been engaged in excavating the area for the new dock, and early in February the contractor, Mr. John Best, commenced the construction of the dock wall by putting in the concrete base on which it rests. Several weeks later the erection of the masonry was begun, and one part has now been raised to a height of about 28 feet. The whole of the foundation of the north wall has now been laid. The wall is about 20 feet thick at the base and diminishes in thickness till it reaches the top, where it is 8 feet. The coping of the wall is 40 feet above the bottom of the dock. Steam navvies are also at work excavating the new entrance

lock from the east pier, which is to be 70 feet wide and is to be fitted with iron gates worked by hydraulic machinery. Another steam navy is employed digging a "road" to form the passage between the new dock and the Albert Dock. The swing bridge across this lock has now been placed in position in order to give communication to the west side of the Albert Dock while the passage is being constructed. The bridge is 130 feet long, 27 feet wide, and weighs about 350 tons, and is to be fitted and worked by hydraulic machinery. On the bridge there are two lines of rails and a footpath on each side. The deepening of the entrance channel is also proceeding satisfactorily, a powerful dredger being engaged in this work, one-third of which has been completed. In the course of the dredging operations some very hard material has been found, consisting of a species of shale, and the same material was also discovered in several parts in excavating for the walls of the new dock.

WINDOW-CLEANING ACCIDENT.

DR. G. D. THOMAS held an inquiry at St. Pancras Coroner's Court on the 5th inst. with reference to the death of David Beckley, aged thirty-seven, who lodged at 71 Dalberg Road, Brixton. The deceased, who was in the service of a window-cleaning company, was on the previous Thursday engaged in cleaning the outside of a third-floor front window at Mr. Anstruther's Catholic Repository, Southampton Road, Havestock Hill. While thus occupied he fell, presumably through standing on the window-sill. After alighting on the window-blind of the shop he rebounded and dropped head foremost on the footpath, fracturing his skull and dying immediately.

The manager of the company by whom Beckley was employed said that every conceivable appliance for the protection of their workmen was provided, but these appliances the men sometimes neglected to use. It was contrary to rule for the deceased to stand on a window-ledge without having a life-belt around him, properly secured.

The coroner pointed out that there was a provision in the Town Police Clauses Act which prohibited, under a heavy penalty, any person suffering a window-cleaner to stand on a window sill or ledge, and also rendered the cleaner himself liable to a fine. This provision, for some inexplicable reason, was not applicable to London, but only to the country.

The jury found a verdict of accidental death, adding the subjoined rider:—"The jury are of opinion that when men are

employed in cleaning such windows as that the deceased was required to clean they should take a life-belt with them in case of necessity for its use. Further, the jury desire to call the attention of the Home Secretary and the London County Council to the necessity of a legislative enactment relating to window-cleaning in the metropolis similar to the provision contained in the Town Police Clauses Act."

The coroner said he would forward the jury's recommendation to Sir Matthew White Ridley and the London County Council as desired.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 14985. Benjamin Foster, for "Improvements in window-sash fasteners."
- 14992. James Backhouse, for "Improvements in or relating to exhibition buildings."
- 15006. Andrew John Oleson, for "Improvements in door-locks."
- 15021. Peter Webber, for "An improved chimney-pot."
- 15028. Arthur Augustus Wincott, for "Improvements in or connected with drain-pipes."
- 15035. Harrison Dease, Rigby and Arthur Hine Knowles, for "An improved stair-rod fastener."
- 15083. Frederick D. T. Lehmann and Peter H. Kohlsaas, for "Improvements in fireproof buildings and structures."
- 15116. Edward Lloyd Pease, for "An improved construction of fireproof flooring and the like structural arrangements."
- 15134. William Johnson, for "Improvements in fire-grates."
- 15151. Arthur Smith, for "Improved means for decorating stairways."

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITION OPEN.

LARGEST MAKERS OF HIGH-CLASS HOSE IN THE WORLD. WORKS: GREENWICH, S.E.

TRADE NOTES.

THE Howrah House, Poplar, London, is being warmed and ventilated by means of Shorland's patent Manchester stoves and grates and special ventilators.

APROPOS of the opening last week by H.R.H. Princess Christian of the Birmingham General Hospital, we may state that the two hydraulic passenger and bed lifts and the whole of the hand lifts were constructed by Messrs. Clark, Bunnett & Co., Limited, of New Cross Road, S.E. The sanitary appliances of Messrs. Morrison, Ingram & Co., sanitary engineers, Manchester, were approved out of a selection of samples submitted by them and the other leading sanitary engineers of this country.

THE Engraved Wood Company, Limited, of Midghall Street, Vauxhall Road, Liverpool, lay themselves out to produce carvings upon the solid wood at a very low figure, about one-tenth of the cost of hand-carved work. The process is a patent one, and their goods are most suitable for decoration of all kinds, and are being extensively used in private houses, offices, hotels, ships' cabins and cabinet-making generally. The designs are artistic, and in very bold relief. The relief is not hollow at the back, but is upon the solid wood; they are durable, and no ordinary pressure from the front can affect them. This firm have just obtained the contract for fitting up with their carved panels the Star Chamber of Leasowe Castle, Cheshire, a residence which until lately belonged to Sir Charles Cust, but which now is in the hands of a company who are transforming the building into a hydropathic hotel.

ELECTRIC NOTES.

THE new electric shop in Portsmouth Dockyard, which occupies part of the site of the old convict prison, has a boiler installation capable of working up to 250 lbs. per square inch.

THE London County Council has at length decided that the Victoria Embankment and Westminster and Waterloo Bridges are to be lighted by electricity. The Council is to have its own installation, and the whole thing is to cost about 22,000/.

AS soon as the electric light has been installed, the clock-tower at the School Board offices on the Thames Embankment will be illuminated at night.

THE watch committee of the Bootle Corporation have issued a third report on a scheme for electrically lighting the borough. The committee recommend that, subject to the approval of the Board of Trade, the Council should approve and adopt a scheme for 8,000 lamps of 8 candle-power, and should apply to the Board of Trade for their approval of the proposed system and sanction to borrow 35,000/., to be taken up as and when required.

VARIETIES.

THE Imperial Insurance Company, Limited (Fire), announce that their London offices will in future close on Saturdays at one o'clock.

THE Duke and Duchess of Westminster have consented to visit Northwich on the 24th inst. to open the technical schools presented to the town by Sir Joseph Verdin, Bart.

THE Duke of Norfolk, accompanied by Lady Mary Howard, visited on the 7th inst. St. Joseph's Home, Howard Hill, to open some extensions of that institution. They consist of a new laundry, baths, and additional dormitory accommodation. The cost has been 1,942/.

A NEW church, erected by the Free Church congregation of Chirnside, was publicly opened recently by the Rev. Dr. J. H. Wilson, of the Barclay Church, Edinburgh. The church, which occupies a good position in the village, has cost nearly 1,500/.

THE British Linen Company Bank is about to erect a building at the corner of Byres Road and Dumbarton Road, Partick. The block, which will be of a very handsome character and four storeys in height, will contain bank offices and shops on the ground floor, and dwelling-houses above.

AT the monthly meeting of the Douglas Town Council, held on the 14th inst., the tender of Mr. W. J. Fargher for the erection of a block of artisans' dwellings in King Street was accepted, his quotation being 3,960/., and for the erection of municipal buildings, public library and fire-station in Ridgway Street, the tender of Messrs. W. Gradwell & Co., Barrow-in-Furness (10,358/.), was accepted. There were eight tenders in all, four English and four local.

AN alarming fire occurred at Derby on the 7th inst., when the extensive timber yard of Messrs. Roe & Son was completely

destroyed, and about 500 persons rendered homeless by the damage occasioned to surrounding property. The loss entailed is tremendous, and there were some cases of personal injury, but fortunately no loss of life.

EVERY year the number of desirable building sites that are worth the attention of speculators is becoming diminished, and it is consequently rare to find one so eligible as the Hyde House estate at Battersea Park which Messrs. Ventom, Bull & Cooper will sell by auction on August 4. The neighbourhood is one of the most densely packed spots round London, and as every inch of the estate can be turned to building account, from the fact that it lies between two main thoroughfares, it will doubtless command a good deal of attention. For hospital outposts, manufacturing or factory purposes, where a large area is required close to London, it would be invaluable.

CULLODEN HOUSE, the ancient seat of the Forbeses, near Inverness, is being dismantled in consequence of the recent death of Mr. Duncan Forbes, and the large and unique collection of Scottish historical relics, splendid old furniture and china, and curious works of art will be sold there by auction next month. Among the Jacobite relics is the bedstead on which Prince Charles Edward slept the night before the battle of Culloden.

SOME eighteen carpenters who were employed in the reconstruction of the Star Theatre, Dublin, struck work because, as is alleged, three of them were dismissed for refusing to unload a cart of timber. The carpenters state that such work is altogether outside their recognised duty. About 150 tradesmen and labourers still remain at work, as they are not immediately concerned in the dispute, but it is anticipated that unless a settlement is soon arrived at with the carpenters most of the hands will necessarily be thrown out of employment.

TROON has experienced a boom in house building during the past two years. About fifty new houses have been erected, most of which are for "letting" to summer visitors, and a number of them are to the order of bona-fide working men. The result of these operations is that quite a new town has been formed in the vicinity of the new passenger station, and that what a year or two ago were green fields now form a beautiful residential district. The prosperity of the golf clubs has also necessitated additional accommodation. A new ladies' club-house is approaching completion, and an enlargement of the gentlemen's one is under consideration. The handsome new Marine Hotel on the links is now completed

and ready for the reception of visitors. Several new blocks of buildings with shops on the ground floor and dwelling-houses above have also been erected in the town, and others are in progress. The building boom is likely to continue for some time.

SOME commotion was caused at the Waverley Station, Edinburgh, on the 7th inst., by the discovery that the scaffold of the new North Bridge had become ignited under the central span. The fire brigade was at once apprised of the outbreak, and a detachment with the necessary appliances was quickly on the spot, police precautions being simultaneously taken to stop the traffic on the bridge if necessary. As it happened, however, the fire was so speedily got under that the danger at first apprehended was avoided. Indeed, though for a few minutes the blazing woodwork looked threatening, so soon as the water was turned on all risk to the scaffolding was passed. Some time, however, elapsed before this was accomplished, owing to the distance the hose had to be carried; but the wind, luckily, not being high, the flames did not spread very rapidly. How the fire originated is not known.

THE premises of the Edinburgh Building Trades Exchange were formally opened on the 15th inst. The Exchange is common to America, and has had a successful existence in Glasgow during the last two or three years, being run on lines made familiar in Edinburgh by the Corn Exchange. The Association was started as a limited liability company with a capital of 10,000*l.*, and is made up of members of the Edinburgh building trades, firms supplying these trades, &c. The first of three floors has two large square rooms, in one of which meetings will take place, and a smaller room, which will be occupied by the secretary. The second of the large rooms will be used as a sample room, as will also those rooms on the second floor, the third floor being tenanted by the caretaker. The building is well appointed, and is lit by electricity.

THE representations which have been made to the Leeds Corporation by the butchers occupying shops in the Shambles to provide a dead meat market, public abattoir, and shops for retail meat dealers, came before a meeting of the Leeds markets committee on the 12th inst., Mr. Knowles presiding. A plan for the building of a dead meat market, with abattoir adjoining, on the site known as the hay market, was provisionally adopted by the committee. It was also decided to make inquiries as to the number of retail shops likely to be wanted, and to get an estimate of the cost of such premises. As has already been

pointed out, the butchers are indignant at the dilatory manner in which this matter has been dealt with by the committee. Liable as the tenants in the Shambles are to receive short notice to quit at any time their landlords choose, they have repeatedly requested the committee to promptly decide one way or the other what they are going to do. If for the convenience of the ratepayers the Corporation desire to keep the butchers together by the erection of a central market, the latter are anxious that no time shall be lost, lest they have to leave the Shambles before the new premises are ready for occupation.

LAMBETH BATHS, KENNINGTON ROAD.

THE Prince of Wales, accompanied by the Princess of Wales, Princess Victoria and Prince and Princess Charles visited Lambeth on Friday last for the purpose of opening the admirably-appointed baths and washhouses which have been erected in the Kennington Road, of which they form a prominent feature. The buildings, which are of pleasing elevation in red brick, are erected on a site which was purchased in the year 1895 at an aggregate purchase price of 14,350/. The contract for the building was signed on June 13, 1896, and the foundation-stone was laid on October 10, 1896, by the Chairman of the Commissioners. They form the largest establishment of their kind in England, and every detail of their plan and general arrangement has been brought perfectly up to date by the architect to the Commissioners, Mr. A. Hessel Tiltman, of John Street, Bedford Row.

The superficial area of the site amounts to 33,330 feet, the whole of which (with the exception of the yard to the boiler-house) is covered with the buildings.

The general accommodation is as follows:—Men's first-class swimming-bath, 142 feet 6 inches by 56 feet 6 inches. Clear size of pond, 132 feet by 40 feet. Men's second-class swimming-bath, 98 feet by 42 feet. Clear size of pond, 90 feet by 30 feet. Women's swimming-bath, 64 feet by 40 feet. Pond, 56 feet by 25 feet. Men's first-class private baths, nineteen in number; men's second-class private baths, forty-six in number; women's first-class private baths, ten in number; women's second-class private baths, twenty in number—being a total of ninety-five private baths. Public wash-house for sixty-four washers.

The first-class swimming-bath has been specially arranged to adapt it for letting during the winter months for purposes of entertainment, and last year special powers were given to the

County Council for the licensing of this class of buildings for music and dancing.

The hall, when arranged for entertainments of any kind, will be entirely shut off from every other portion of the establishment and will afford seating accommodation on the ground floor for 1,222 persons and on the gallery floor for another 300, making in all seating accommodation for 1,522 persons. The first-class swimming bath (with that of the Hornsey Road baths) contains the largest public swimming pond in use in Europe, requiring some 250,000 gallons of water to fill it. A well is being constructed for the supply of water for this and the other swimming-baths of the establishment, in order to save a large portion of the cost of supplying the water.

The greater portion of the interior is lined or faced with glazed bricks for cleanliness and for minimising the cost of periodical repair.

The lighting is by electricity, the current for which will be generated in the establishment.

The building has been erected by Mr. Walter Wallis, of Lincoln House, Ramsden Road, Balham; the engineering work has been supplied by Messrs. J. & F. May; and the ironwork by Messrs. Moreland, of Old Street, E.C.

ENGINEERING CLASSES, LIVERPOOL.

ON the 4th inst. a meeting was held in the Walker Engineering Laboratory, University College, Liverpool, to announce the results of the last examination. The prizemen were as follows:—

Machine design (third year): Prize divided between Messrs. W. H. Riddlesworth and E. Brown. Machine design (second year): First prize, Mr. S. Holt; second prize, divided between Messrs. A. Thomas and F. W. Hewitt. Machine design (first year): First prize, Mr. W. L. Bomford. The following results of the University examinations were then read out:—Honours B.Sc.: First class, Messrs. W. H. Riddlesworth, E. Brown, and P. S. Couldrey. Second class: C. H. Stewart. Final B.Sc. ordinary: First class, H. Rigby. Second class, J. E. Evans. Intermediate B.Sc.: C. C. S. Anderson, A. Pinto Leite, C. Stewart. Professor Hele-Shaw then called upon the Principal to address a few words to the students.

Dr. Rendall had great pleasure in congratulating the department upon the satisfactory work accomplished during the past session. He was pleased to find that three out of the four engineering students had gained a first-class in the

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

Honours School of Engineering, while the other departments had each placed one in the first class in their respective schools, the fourth engineering student taking a good place in the second class. Five out of the six engineering students who sat for examination had passed for the B.Sc. in engineering, and the results reflected great credit upon the teaching staff. He was also glad to find that not only had the engineering department of the college taken a high place in the University examinations, but the general work of the engineering students, as shown by the exhibition in the Museum, was of that excellent character which proved that in all directions the vigour, strength and heartiness of the department was sustained even to the end of the session, as attested by the attendance at that meeting and the terminal examinations. He then referred to the athletics, and the fact that the engineering section of the college had won the challenge cup from the other three divisions of the college, viz. the arts, science and medical, in the annual departmental contest. Referring to the general class lists, he assumed that a jubilee spirit pervaded the whole department, from the fact that there were no students unclassified.

Professor Hele-Shaw thanked the Principal for his encouraging remarks, and said that out of fifteen honours candidates in engineering from Manchester, Liverpool and Leeds there were five in the first class. Of these three were from this college and one had been specially recommended for a university scholarship on account of the excellence of his work. He alluded to the important step taken by the great parent institution in adopting for all future candidates for membership of the Institution of Civil Engineers an examination, a step which, although talked of for so many years, had been taken with the greatest deliberation and caution. This might greatly affect the position of the profession, and tended to place it more in line with that of the Church, law and medicine, where, of course, examinations were compulsory. It showed that the oldest and wisest heads of the profession considered that engineering was now recognised as requiring the highest scientific training, as well as the practical experience which was even more necessary than ever. The Professor commended the work of the College Students' Engineering Society, and referred to the members' successful trip to London during the Easter vacation. He hoped they would ever regard the University College as the alma mater where they would always receive a welcome if they visited it at any future time, and he hoped that some of them would remember the students of the college when they were looking out for a young and promising assistant.

THE CHOIR, CANTERBURY CATHEDRAL.

ST. MICHAEL'S, OR WARRIORS' CHAPEL, CANTERBURY.

SYDNEY HOUSE OF REPRESENTATIVES.

CARR'S LANE CHAPEL, BIRMINGHAM.

RECENTLY some striking changes have been made in the interior aspect of Carr's Lane Chapel. The old gallery fronts, which have been the subject of various experiments in decoration, have now been superseded by fronts of solid English oak. The decoration is brought out mainly by the contrast of two tones of oak, the polished flat surface and the dead grain of the incised ornament, with the aid of simple colours judiciously used as accessories rather than as variants to the general effect, which is intended to suggest the fine inlays seen in old Grecian work. The seating in the body of the chapel has been simply repolished. An important change, however, has been made in the galleries. The whole of the pews have been removed, and for them have been substituted single lift-up seats, similar in structure to those with which theatre-goers are now familiar. An opera-house effect, however, has been avoided by making the chair backs of plain oak, and the alteration gives more than a hundred extra seats. The walls and ceiling have been effectively redecorated, and the iron columns and arcading introduced a few years ago to support the roof have been made to look more ornamental and, at the same time, less obtrusive. These decorations have been carried out in a Classic style, and the colouring has been kept in quiet tones, creams, greys and soft terra-cottas predominating. The ceiling, which is in panels, is picked out, and the ornamental parts, which are in modelled plasterwork, have been relieved with gold. The cove is panelled out and decorated in a very elaborate manner, as are also the walls. The iron girders and supports at the entrance to the body of the chapel have been hidden under Classical moulding of fibrous plaster, the making of which is a new Birmingham industry. Several structural alterations have also been made. Screens have been erected in the vestibule to add to the comfort of the congregation, and additional exits have been provided at the pulpit end of the chapel on each side from each of the galleries and the aisles. The chapel is now lighted by electricity, chiefly by means of light brass pendants. A thorough renovation of the organ has taken place; tubular pneumatic action has been fitted throughout. The internal

work at the chapel has cost some 2,500/., but including the structural alterations and the contemplated reconstruction of the lecture-hall, the expenditure altogether will amount to about 6,000/.

THE PARK HOSPITAL, HITHER GREEN.

LEWISHAM wore a festive air on Monday last in honour of the visit of the Prince and Princess of Wales, the object of the visit being the opening by H.R.H. of an important addition to London's numerous hospitals. The Park Hospital, as the new building is called, is the ninth hospital erected by the managers of the Metropolitan Asylum district for the reception of patients within the parishes and unions of the Metropolis suffering from infectious diseases. Work was commenced on the hospital in the autumn of 1895, and, with the exception of the delay of some weeks caused by the strike of 1896, building operations have regularly proceeded up to the present time. With the exception of two hospitals provided by the Board for convalescing patients—one at Winchmore Hill and one at Darenth—the Park Hospital is probably the largest infectious hospital, not only in London, but in the United Kingdom. It is situated on an elevated site (the highest in the district) near Hither Green station, on the South-Eastern Railway, about three-quarters of a mile from Lewisham and six miles from London Bridge. The average level is about 95 feet above high-water mark, there being a difference of over 30 feet in altitude from east to west, and of 23 feet from north to south. The "infected" buildings are generally about 100 feet from the boundaries of the site. In this zone is retained a large number of beautiful full-grown trees, and a road has been formed round giving access to all parts.

The site consists of 20 acres of ground, or about 2½ times the area occupied by St. Thomas's Hospital, and in the forty-two buildings of which the hospital is composed, upwards of 10,000,000 bricks have been used (about double the number employed in the construction of the Blackwall Tunnel). There are six miles of drains within the hospital area, twenty-nine miles of water and steam-pipes, three miles of roof gutters, forty-two miles of electric wires and 350,000 slates. The pavilions, which are, of course, isolated, are disposed on a roughly radial plan, and are connected by covered ways with the kitchen, steward's stores, water tower, dispensary and telephone exchange, all of which are in the centre, together with the male and female servants' residences, the latter facing

the road. The distances to be traversed by the staff, the lengths of pipes, &c., are thus reduced to a minimum.

All the pavilions are axially nearly north and south, and are two-storeyed, with fire and sound-proof floors. There is no internal communication between the two floors, the upper one being reached by an external staircase from the covered way. There is an ample provision of lifts for coals, food, trollies, &c.

A scarlet fever pavilion contains on each floor three wards—one for twenty beds, one for two beds, and one for one bed—a ward scullery and other offices, the scullery being fitted with hot-plate kitchen, sink, &c. There are also provided a bathroom, two water-closets for patients and one for staff, sink-room, two bed-pan slop sinks, lavatories, movable baths, &c.

All the wards are heated by hot-water radiators in cases designed to admit fresh air, which air is then warmed and passed into the ward at a low velocity calculated to change the air in each ward three times per hour. The inlet of cold air can be adjusted to suit varying wind pressures.

In addition there are central open fireplaces and stacks of flues of novel design specially made by the architect for this hospital. In these central stacks every smoke flue can be swept from the external basement. The smoke flues are surrounded by aspirating flues, which, being thus heated, induce an up current, and so draw off the heated vitiated air from the centre of the wards. In each stack (which is externally made of glazed faience) are eight of these air flues and four smoke flues, and the whole are contained in an area 3 feet 6 inches square. All these air flues can be swept, and all have outlets on two sides. These stacks have formed an object of interest to a large number of architects and public officers during their construction.

Throughout the pavilions there is not a single buried pipe or inaccessible space of any kind. The linings of the sash windows are made to open for sweeping. Weights and sash lines can be removed and renewed without taking out the sashes. In some of the buildings is a new type of sash window designed by the architect. There are no hollow linings, the frame is solid, but the sashes slide up and down. In addition, they are made to open inwards to throw the air upwards. They can be regulated to any angle, and can be opened to admit air through the full area of the frame, i.e. double the area of an ordinary sash window. For "scouring" a ward this is of value. They can also be cleaned, painted and reglazed from the inside. The mode of securing these sashes is by a fastener on the bottom rail, avoiding the necessity in high windows of steps.

It also enables the sashes to be made rigid, so that they cannot rattle in a wind.

In one of the wards ordinary hollow sash frames have National Accident Prevention Window Co.'s sashes, which are hung on centre pivots and are similarly accessible for cleaning, painting and reglazing from the inside. The w.c.'s used are of the bracket type fixed clear above the floor, which can thus be readily kept clean. The main waste from the baths is an open trench in the floor, and this principle of ready inspection has been observed throughout. Attached to the pavilions at both ends are airing balconies to which the beds can be wheeled for "sun" baths, and every pavilion has its own airing court. The laundry—divided into two parts for patients and staff respectively—is a long rectangle. Soiled linen enters at one end and passes through the several cleansing processes to the distributing room at the other.

The disinfectant is at the entrance to the laundry yard. The boiler-house is partly under the laundry, and contains four large boilers, with "economiser" connected to the furnace shaft. The engine-room contains laundry-engine, and the electrical plant of three engines and dynamos for lighting the hospital. The water supply is taken from the chalk, and subjected to a softening process.

The water tower, which forms an important central feature in the design, contains a four-dial clock.

The kitchen block is a one-storeyed building, the walls of which are faced internally with glass, while the fittings are up-to-date specimens of gas and steam apparatus. The female servants' block contains a separate cubicle for each maid, mess and sitting-rooms, &c. The matron's flat is in the same block. Similar accommodation is provided for the male servants. The Nurses' Home is divided into three houses, connected with glass and iron corridors on each floor as an additional means of egress in case of fire. Separate dining and sitting-rooms are provided for charge and assistant nurses, and each nurse has a separate bedroom.

In these residences as well as in the fever pavilions, all water-closets, lavatories, &c., are in detached towers, approached by enclosed passages, so that every building is practically separated from its sanitary annexe. All annexes are warmed and hot water is laid on to baths and lavatories. There are telephones in the various buildings, and from any one an official can communicate with every other building throughout the hospital. Fire hydrants are fitted throughout the buildings and in the yards, and fire-alarms in every block communicate

with six alarm bells in various parts of the hospital, while a special arrangement is made to call all the staff together in emergencies.

Covered ways connect all parts. These are of brick and concrete. The floors and steps are of red granolithic concrete. Under all these covered ways are well-lighted subways in which are fixed the water and steam-mains and heaters, electric light, telephone and fire-alarm cables, &c., all accessible at any point for repair.

The various diseases are kept separate in the drainage scheme, and all "non-infected" drains are kept distinct from the others. The manholes or inspection-chambers are of solid glazed fire-clay (Border's patent), the bottoms and all the branches being cast in one piece. The pipes are of the Archer jointed type, laid on and covered with concrete. The whole pipe system is divided into separate lengths for efficient ventilation, and all drains are fitted with flushing-tanks.

The architect is Mr. Edwin T. Hall, F.R.I.B.A. and F.S.I., Mr. Turner, chief clerk of works, and Mr. Mansell, assistant clerk of works.

Messrs. Leslie & Co., Limited, of Kensington, are the contractors for the hospital. The contract sum is 210,000*l.*, a little less than the architect's estimate.

The locks, lock-furniture and brass-foundry were supplied by Messrs. Colledge & Bridgen, of Wolverhampton.

Messrs. John Hall & Co., Fireclay Works, Stourbridge, supplied all the ivory-coloured glazed bricks, of which large quantities have been used. Many of these bricks were specially designed by the architect to do away with all square and sharp corners, and thereby prevent any accumulation of dust or dirt. The same firm supplied large quantities of fire-bricks and clay.

MUNICIPAL ENGINEERS' CONFERENCE.

THE annual conference of the Association of Municipal and County Engineers was opened in the Town Hall, Westminster, on the 8th inst. Mr. F. J. C. May, the retiring president, presided at the opening of the meeting and was supported by Sir A. R. Binnie, chief engineer to the London County Council, president elect, and amongst those present were Mr. T. de Courcy Meade (Manchester), Mr. H. Percy Boulnois (Liverpool), Mr. J. Cartwright (Bury), Mr. S. S. Platt (Rochdale), Mr. H. Fowler (Manchester), Mr. J. E. Sharpe (Clitheroe), Mr.

DOWSON, TAYLOR & COMPANY, Ltd.,
14 VICTORIA STREET, LONDON; AND BLACKFRIARS BRIDGE, MANCHESTER.

J. Cook (Lancaster), Mr. G. E. Shore (Crewe), Mr. F. S. Butson (Burnley), Mr. W. Atkinson (Kiveton Park), Mr. J. T. Landless (Nelson), Mr. A. O. Fraser (Allerton) and others.

Sir A. R. Binnie, in his presidential address, dealt with the institution and work of the London County Council. He said that during the short period the Council had been in existence, and notwithstanding the natural opposition to any new body, it had done an enormous amount of remarkably good work. The public out of doors were perhaps too much in the habit of judging of the work of the Council solely by those controversial matters which were the subject of discussion at its weekly meetings, and either forgot or ignored the enormous mass of work which was performed by means of its committees without controversy and which was work for the public good unanimously acquiesced in by all its members. During the last seven years a vast improvement had been effected in the purity of the Thames by the mode in which the sewage was discharged at Crossness and Barking by the establishment of precipitation works and the removal to sea twenty miles below the Nore of about 2,000,000 tons of sludge per annum. Great improvements had been effected, but yet they had not approached what they might hope to attain when they became better acquainted with the right mode of dealing with huge volumes of sewage. One of the great difficulties which surrounded all London questions was the magnitude of the problems with which they had to deal. Take, for instance, main drainage, which now amounted to over 200,000,000 gallons a day, or half the average flow of the Thames at Teddington Weir. With reference to local government, he was of opinion that there was a great deal of energy wasted in the useless discussion of professional details. Local governing bodies must, of course, discuss the general principles of the work which they entrusted to their officials, but having done so, he thought it would conduce to the general welfare if there were less discussion of details and criticism of uncompleted work. He knew there were many points relating to the housing of the working classes and the rates of pay and working hours of the labouring classes with which only an assembly representative of the ratepayers could properly deal, but on purely professional details he thought there was too much criticism. He felt that success in the public work in which they were engaged could only be obtained when they were working, not only in unison with the general policy of their governing bodies, but also in terms of unity and friendship with the various constituent members of those bodies.

Mr. W. Dibdin, chemist to the London County Council, read

a paper on "The Biological Purification of Sewage." He said the history of the development of the process of treating sewage by biological agency might be said to have commenced in connection with the inquiry into the condition of the river Thames by the Royal Commission presided over by the late Lord Bramwell. The investigations which were carried out by the various chemists and biologists engaged established the position that the sewage was ultimately destroyed by the action of living organisms, and that it was only when these were not allowed full scope to exercise their beneficent life action that putrefaction resulted and the polluted water became a foul nuisance. The biological filtration of sewage was carried still further in connection with the treatment of the sewage effluent at Barking, where results never before anticipated were obtained. The fact that a bad effluent could be purified to a degree comparable in colour and character to that of a clean river water, and at a rate equal to 1,000,000 gallons per acre per day came as a startling surprise upon the community, and, although it was at first received with a considerable degree of doubt, the present experience throughout the country at many places where the coke-breeze filters had been adopted had established the system as being one of the most useful economical advances of practical sanitation.

Mr. E. J. Silcock, borough engineer of King's Lynn, afterwards read a paper on tramway haulage, and Mr. R. J. Thomas, county surveyor of Buckingham, one on the Buckinghamshire road system of equalising the highway rating.

Mr. J. T. Eayrs, of Birmingham, read a paper on brick-paving for carriageways. He said the question of paving roads with bricks had received very little attention in England, and although this country was justly celebrated for the quality of its bricks, and notwithstanding the fact that such large quantities were used for footpaths, strangely enough it had been left for their American cousins to show what could be done in the way of providing a brick pavement for carriage traffic. One American State alone produced 500,000,000 paving bricks per annum; another 300,000,000. He had obtained particulars from 52 towns and cities where no less than 410 miles of brick-paved roads had been laid. It was claimed that neither granite, asphalt nor wood could offer so many advantages as vitrified brick as a paving material, and that if properly laid it was as noiseless as any other kind of pavement. The surface was smooth without being slippery, it offered a minimum of resistance to the passage of traffic, and inflicted a minimum amount of wear and tear on horses and vehicles. It was

SOHO COWL AND VENTILATOR (NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

practically impervious and therefore perfectly sanitary, was easily cleansed and therefore required far less scavenging than any other paving, it could be washed without injury or becoming slippery when wet, was readily taken up and relaid, was reasonable in first cost and maintenance and had a life which compared favourably with other materials, such as wood, asphalte, &c.

Mr. L. H. Isaacs, surveyor to the Board of Works for the Holborn district, read a paper on tramways laid in asphalte carriageway pavements in the city of Berlin, and Mr. W. Weaver, Kensington, read a paper on street scavenging.

The afternoon was devoted to a visit to the works of Messrs. Doulton & Co. at Lambeth.

A SCOTTISH CHURCH.

IN the Glasgow Sheriff Court evidence was given before Sheriff Strachan to determine whether Shettleston parish church should be rebuilt or repaired. Mr. J. Leiper Gemmill, writer, appeared for the Rev. John White, minister of the parish, while Mr. William Borland, writer, represented the heritors.

Mr. Robert Dalgleish, architect, Glasgow, said that he had examined Shettleston Church. The roof had been unskillfully constructed. The stone and mortar of the building were good. The front wall and the two side walls had kept their position. There were one or two slight hair cracks in the front wall that had been there since the beginning. The back wall was 5 inches off the plumb at the top owing to the placing of the chimney of the heating apparatus up it, and also owing to defective construction of the roof. The front wall, being stronger than the back wall, threw the lateral pressure against the back wall, which gave way. The columns which had been put in to support the roof had not yielded. In consequence of the sagging of the roof and the partial displacement of the brick wall, rain water got into the building. There was almost a total want of ventilation in the floor. The place had been neglected, and some of the gratings were choked with mud. Nobody seemed to open a window, or do anything to ventilate the church, and there was a close, nasty smell inside. Some of the woodwork was what was called worm-eaten, although it was not a worm at all, but a beetle—what superstitious Scotch people called the death-watch. The gallery was not unsafe, even though it were filled with people. He proposed that there should be a new roof, using the old

slates so far as good. He approved of Mr. Gordon's plan of a roof. The back wall should be taken down as far as it was off the straight. The other walls would be repaired and pointed. The area floor was not bad, but he was of opinion that it should be lifted, asphalte laid below it, and new flooring laid on the asphalte. The pews would be replaced. They were made of good timber, a timber which could not be got in Glasgow now. The wood was fit for varnishing if it were washed. He would simply repair any defects. The decayed wood of the gallery should be renewed, and a runner put in to support the ends of the joists. He proposed to floor the gallery under the seats where there was no flooring at present. If the repairs he suggested were carried out, the church would be safe, substantial and comfortable for many years. It would be in as good a condition as the majority of the old country churches of Scotland, and in better condition than Shettleston Church had ever been. These repairs were estimated to cost 941*l*.

By Mr. Gemmill: He visited Shettleston Church twice, and examined it carefully for dry rot. Six or seven places were opened. He saw no indication of dry rot. At the end of the west passage he saw natural decay. The wood was soft and brittle owing to damp.

Mr. Gemmill: Have you had much experience of dry rot?

Witness: I am sorry to say I have; in my own house. Mr. Dalgleish, after examining a sample of wood, said he did not think that it was affected by damp rot. It seemed to be only decay arising from damp and age. If he wanted to know about dry rot he would not go to the "Encyclopædia Britannica." There were very much more modern works on timber and decay than that.

The Sheriff: The last edition of it is not very old.

Mr. Gemmill asked witness if he had seen "Notes on Building Construction."

Witness: I think I have got far beyond these elementary treatises at this time of day.

Mr. Gemmill: Have you seen the "Treatise on Hygiene and Public Health"?

Witness: No; I never saw the book. And if you make me a present of a copy I won't promise to read it.

Mr. Gemmill: Have you read any recent books on building construction?

Witness: I have read the book of experience, and that is the best of all books. Witness having been shown a piece of wood from the pulpit, said that there was a slight trace there of the dry rot plant. Replying to further questions by Mr.

ESTABLISHED OVER HALF A CENTURY.

Gemmill, the witness said that he had seen the spores of dry rot going through a brick wall, but they could be cured by a strong solution of sulphate of copper. Witness, continuing, said that Gill stoves, such as used in Shettleston Church, were getting obsolete now, but they were still introduced in many country districts, and there were many of them in use in Glasgow. Generally, heating now was by coils and steam.

Mr. Gemmill handed witness two pieces of decayed wood, and asked if there was much wood like it in the gallery would Mr. Dalgleish consider the gallery in a safe condition?

Witness: There is no immediate danger.

The Sheriff: There is no immediate danger of its coming down with a rush.

Witness: No.

Mr. Gemmill: Would it surprise you to learn that one of our witnesses said the main beam was rotten?

Witness: I am old enough not to be surprised at anything. I never saw it when I was there.

Mr. Gemmill: If the main joists of the gallery have no rest on the wall, and if the people are sitting at the back of the gallery, will their weight not act as a lever and affect the woodwork where it rests on the pillars?

Witness: He made no suggestion in his scheme as to widening the seats or making them more comfortable. That was a modern improvement, not a repair. The back wall had sunk a wee thing at the west end, but he thought that happened soon after the church was built. In a modern church he would consider 150 or 160 cubic feet per sitter a fair allowance.

By Mr. Borland: The amount of cubic feet per sitter depended upon the width of the pews and the height of the roof. Modern churches were very much higher than this one, and even old churches—the cathedral, for instance. In schools in England a 10-feet high ceiling was common, but in Glasgow he had built a school with a roof 17 feet high. The masonry of the back wall of Shettleston Church was very good, but it had been weakened by cutting the channel for the flue in the centre of it.

Mr. Matthew Henderson, builder, Glasgow, said that he carefully examined Shettleston Church. The wood of the roof was Danzig red pine, a wood that was not got nowadays. It was the very best wood among rough timbers. The roof was not in a good condition, as it had sagged down 4 or 5 inches. Some of the joists of the gallery were decayed with old age, but the rest were as good as ever. Small parts of the gallery floor were affected by decay and tear and wear. The pews in the

gallery and the area required repairing. The inside of the area floor was good, but where the sleepers came in contact with the wall they were decayed with damp or old age. He did not find any timber affected by dry rot. The cause of the bulging of the back wall was the sagging of the roof and the cutting of the channel for the flue. The gallery would stand although the back wall were taken down, because there were double rows of pillars. He proposed to put on a new roof. A good deal of the old wood could be used. He would take down all the back wall, except the two corners, and rebuild it with the old stones, remove all the area floor and all the lath and plaster under the gallery, and make good any deficiencies in the woodwork, providing a runner to support the joists, although he did not think that necessary. After the repairs the church would be in a better condition than ever, and it would stand for another 60 or 70 years. He had put in an offer to execute the repairs, which he was prepared to carry out for the sum named if the heritors accepted it.

By Mr. Gemmill: He saw evidence of decayed wood all over the building, but the samples he produced were average specimens of the wood in the church. They were not from wood where the air circulated round it; they were taken from below the seats. In parts of the samples there were serious indications of worm-eating. The seats were old-fashioned, so that a man could lie back and take a sleep. In new churches the seats struck the sitter in the middle of the back, so that if he took a wink he tumbled over on his neighbour.

Mr. Gemmill: The new seats are a great improvement?

Witness: That is very questionable.

Mr. Gemmill: What church do you sit in?

Witness: I sit in Dr. King's church at Bearsden. Some of the seats there are like those in Shettleston Church. I sit in one of them myself, and I enjoy it very much.

The Sheriff: For the facility for sleeping?

Witness: It is a good, old-fashioned sitting.

Mr. Henderson, continuing, said that wood affected by dry rot had a skin, and was quite smooth beneath, crumbling away to the touch. Dry rot would commence anywhere, even on the top of the pulpit.

The Sheriff: Or in the pulpit.

By Mr. Boring: There must be a moisture, or dry rot would not grow. If a bath-room floor were washed and linoleum laid down before the wood had dried, dry rot would result. He had seen that in hundreds of cases.

The hearing of further evidence was adjourned.

THE TRAINING OF TECHNICAL TEACHERS.*

ONE of the most marked features of the recent development of technical education is the growth of facilities for instruction in what are termed "technological" or "trade" subjects. During the ten years prior to 1896 the number of separate classes registered by the City and Guilds of London Institute increased from 262 to 1,120; while in half that time the number of students more than doubled, the total last year being nearly 27,000. The programme of the Institute for the current session provides for examination in no less than sixty-eight different subjects, sixty-three of which are directly connected with important practical industries. Large as these figures are, they do not include all the subjects in which classes for imparting distinctly trade instruction are held, as nearly every technical school or institute conducts special classes suited to the particular needs of its locality. These include, for example, such subjects as horticulture and agriculture, tailoring and upholstery, artificial flower making, pattern making, smiths' work, and many others not included in the City and Guilds Institute programme. It is, moreover, certain that however large the present supply may be as compared with ten years ago, the next decade must mark an equally great advance if the trade workers of our country are really to be provided with efficient technical education.

From what has been already said it will be understood that this paper refers only to instruction in distinctly trade subjects, and not in technical subjects generally. Admission to these is primarily, and in some institutes entirely, confined to *bonâ fide* workers in the trade concerned, this qualification being compulsory for all students upon whom grants are claimed from the City and Guilds of London Institute.

The greatest of all difficulties in connection with such classes as these is undoubtedly the provision of satisfactory and efficient teachers. The larger technical institutes are often asked to recommend teachers, and cases are not infrequent where suitable men are actually bought at high prices from one town to another in order to conduct classes. In other cases advertisements have quite failed to bring suitable applicants, while it is a common condition to find the successful teacher engaged for four, five, or even six evenings weekly at different institutes. Indeed, it is probably the case that many centres cannot conduct classes for want of teachers, while it is certain that many others fail to make classes successful owing to the teachers

* A paper by Mr. Sidney H. Wells, principal of the Battersea Polytechnic, read at the International Congress on Technical Education.

being insufficiently qualified. The wonder is not that some classes fail, but that so many have succeeded, for if any vital matter has been overlooked and neglected it is surely that of the training of the teachers.

What, then, are the essential qualifications of a teacher of technical classes?

The first and most natural is that he should possess a practical knowledge, acquired in the factory or workshop, of the subject to be taught; the second, that he should possess a sound knowledge of the elements of the arts and sciences applicable to the subject; and the third, that he should be able to impart his knowledge to others, to arrange a syllabus of instruction, to manage a class—in a word, to teach.

The first of these conditions is apparently the most easy to satisfy, and of its absolute importance there can be no question. Those who have had experience in such matters will know what great value the trade student attaches to the practical knowledge and position of the teacher, and how he is attracted by the man of recognised experience and skill, as much as he is repelled by the absence of these qualities. But here a very real difficulty presents itself. There is a growing feeling that a man cannot teach efficiently after working hard all day at his trade, the suggested remedy for which is to remove him from the factory or workshop, and let him devote his time entirely to teaching. But in doing this he gradually loses that very qualification which is regarded as essential, for he is no longer able to keep in touch with his trade, or to gain experience of its new methods, processes or machines, and he very soon ceases to be regarded as a "practical man." This may not be of equal importance in all trades, but in the majority of cases the loss of practical qualifications is probably only a question of time. On the matter of working all day and teaching in the evening, the author may mention that he knows six teachers of trade classes who teach from three to six evenings per week each, and in all cases after working at their respective trades during the day. Perhaps, when the supply of good teachers is greater, this condition of work will cease, for it can scarcely be permanently efficient.

The second qualification, that of a knowledge of the arts and sciences connected with the subject, does not, of course, apply with equal force to all trades, and depends also upon whether the teacher's work is limited to workshop instruction or includes the conduct of the lecture or theory class. Such a subject as plumbing, for example, including, as it does, something of the sciences of chemistry, physics and mechanics, requires a wider range of knowledge than, say, plasterers or

smiths' work. The present generation of trade teachers have had to gain their theoretical knowledge in evening classes, by no means an insufficient medium, provided the course of study is sufficiently wide, properly co-ordinated and continues for a long enough time. But how rare are the practical men who have taken such a course as this will be apparent to all who have tried to obtain them. In some of the newer subjects of trade instruction they are unobtainable, and one is forced to be content with the essentially practical man who has never attended a class or undergone an examination. The author has had this experience in three important subjects within the last two years, and others have probably met with the same difficulty. Not that the certificated teacher is by any means always the better, or the uncertificated one incompetent. In cases known to the author the teacher of a trade class failed to pass the examination, while three of his students were successful, two of them gaining medals; and in another the class which had been large and successful under a purely practical teacher fell to pieces under a teacher whose theoretical qualifications were all that could be desired.

The author is aware that experiments have been made by the Plumbers' Company in sending selected plumbers for a course of theoretical training at a university college with a view to becoming teachers, but he believes the time was quite insufficient for anything like a proper course. Such a plan obviously has very much to recommend it, but the chief difficulty would appear to be in the men being spared by their employers for a sufficient length of time, while it is not improbable that they are less able to assimilate knowledge when crowded into a few weeks or months than when spread over several years, as in evening classes.

Much of what has been already said applies also to the qualification of ability to teach. How often it is that the man with ample knowledge of both theory and practice is unable to impart it to others, and fails altogether as a teacher. Sometimes it may be due to want of interest and enthusiasm which nothing can cure, but more often it is want of method, of inability to arrange the work in its natural sequence, of too great haste and lack of clearness, and of faults in elocution, all of which it is possible to improve.

Owing to the difficulties which the author has himself experienced in obtaining suitable teachers, and the belief that the general demand for teachers was quite in excess of the supply, he has for some time given attention to methods for meeting the deficiency. At the commencement of last session he formu-

lated a scheme for the institution of scholarships for training instructors in trade subjects at the Battersea Polytechnic. Scholarships were offered in each of the trades of bricklayers, carpenters and joiners, masons, plasterers, plumbers, and painters and house decorators. The scholarships gave free admission to evening classes in approved subjects for two, three, or four years, with the provision of text-books and materials. The holders were to be under thirty years of age, to be practically engaged in one of the trades mentioned, to promise to attend at least two evenings weekly for not less than two years and to undergo examinations as required.

It was understood that they would receive special attention from their teachers, and that during the last year they would receive instruction in matters relating to the conduct of classes. Should occasion require the scholars would, if qualified, be engaged as temporary instructors, and in the event of vacancies for permanent instructors they would be given the preference over other applicants.

This scheme having come under the notice of Sir Philip Magnus, he was able to obtain from the Plasterers' Company a grant of money for increasing the value of the two scholarships offered for plasterers' work, this being one of the subjects for which there is much difficulty in obtaining teachers.

Of the twelve scholarships offered only nine applicants were found suitable, namely, three in carpentry and joinery, two each in masons' work and plumbing, and one in plasterers' work, and painters and house decorators' work. Two of the scholars relinquished their scholarships within a month, but the others attended regularly for the classes prescribed, underwent the examinations and generally acquitted themselves well.

The scholarships of these seven students will be renewed next year and afterwards until they have completed the course of study agreed upon, provided they continue to be satisfactory. In all cases they are required to attend classes in subjects of art or science connected with their trade in addition to the regular trade class, and the scholarship is only tenable while they continue working at their trade during the day. In the last year the scholars will be expected to attend classes in elocution, and to act as assistants to some senior teacher whose methods of teaching are deserving of imitation. They will also receive a few special lessons of a thoroughly practical character dealing with such matters as the arrangement of courses of study, the management of classes and methods of teaching, and will be expected to draw up syllabuses of work, and to give practical lessons before a teacher qualified to criticise and

advise. Other scholarships will be awarded in the coming session.

Of the ultimate success of such a scheme as this it is impossible to do more than prophesy, but the author has strong hopes that it will prove successful, and will produce teachers of good all-round qualifications. One difficulty would seem to be in influencing the character of the work of the scholar in the workshop or factory and in insuring its sufficiency, but this can partly be met by selecting scholars who are employed by good firms, or something might be done by enlisting the co-operation of the employers. Considerable time is needed for such a training as suggested, but it is difficult to see how this can be avoided if the practical experience in the shop or factory is to be gained concurrently with that in the classes, a condition which the author regards as essential to success.

The author ventures to suggest that some scheme of this character might be adopted in all our large technical institutes, and that in fact it would be a good thing if at least one student-teacher could be attached to every trade class throughout the country. To further insure its success, it would appear desirable that the scholarship awarded should include a money payment in addition to free education, and he strongly urges the consideration of this matter upon the London Technical Education Board, the technical committees of boroughs and county authorities and other bodies interested in technical education. After all, is there any subject more important than that of the teachers who are to train the workers of this country in the scientific principles and practice of the industries in which they are engaged? The teaching of subjects of science, art, commerce and domestic economy is fairly well provided for, but in that of technology the demand is considerably in excess of the supply, and fortunately for our industries the demand is constantly increasing. The syllabuses of instruction and examination are gradually being widened to include a requisite knowledge of the arts and sciences connected with the industries concerned, and efforts are made to induce trade students to attend classes in certain subjects of art or science in addition to the technical or trade class. It is probably not too much to say that these efforts will largely be futile until the teachers who have no knowledge of these subjects themselves, and are not in sympathy with and often opposed to their introduction, are replaced by others who can best show the value of a thorough course of training by their own position and work, and can assist in imparting it to their students.

Mention should be made of a method of conducting technical

classes which exist in some institutes where the teaching is carried on by the professional man or teacher in conjunction with a workshop instructor. For example, classes in plasterers' work, and painters and house decorators' work would be taken by practical teachers engaged in the trades under the immediate direction and with the assistance of the art master, or classes in brickwork would be conducted by an architect assisted by a practical instructor, the lectures and general supervision of the workshop classes being undertaken by the architect. But such an arrangement is obviously somewhat costly, and its efficiency depends largely upon the training and qualifications of the art master or architect. Generally speaking, this class of teacher is wanting in practical experience, and the arrangement is obviously not adaptable to all subjects.

In conclusion, the author would desire to express regret that pressure of work has prevented him dealing with the subject with more care and detail than has been possible in this paper. He believes that the great importance of the subject will be generally acknowledged, and he hopes that its consideration by this congress will make for the further development and success of the great work of technical education with which it is so closely concerned.

CONTRACTS FOR GIRDER BRIDGES IN EGYPT.

LORD CROMER in a despatch to the Marquis of Salisbury on the subject of a communication from the British Chamber of Commerce, which has been circulated to the various Egyptian departments, writes:—

The recent breakdown of the Embabeh bridge, which will now have to be strengthened at a cost of some 33,000*l.*, shows clearly enough that the criticisms passed by several high English authorities on this structure, before it was commenced, were well founded. Further, it shows that the system heretofore adopted in Egypt for the construction of certain classes of public works, notably that portion of it which involved the almost invariable acceptance of the lowest tender, is defective. Any changes in the system will require careful consideration. I do not, however, propose to enter fully into this branch of the question at present, but I may say that, although there are many competent engineers in the service of the Egyptian Government, one of the main reasons for the failure, which has unquestionably occurred, has been the want of a highly-trained specialist in the science of bridge-building. That want has

now been supplied by the appointment of Mr. Robertson to be president of the Railway Board. Mr. Robertson's well known qualifications constitute in themselves a guarantee that no such failure as that which has taken place in connection with the Embabeh Bridge will recur in the future.

My immediate object is to make some remarks which may possibly be of use to English bridge-builders in the event, which is not improbable, of further bridges being constructed in Egypt.

It would, I venture to think, be a mistake to suppose because a bridge has been too cheaply constructed, and has consequently broken down, that therefore the most expensive offer should for the future be accepted. The English offers, I should mention, have invariably been much higher than those of any other nation.

In the case of the Embabeh bridge seven offers were received. Of these one was from an English firm; it amounted to 138,000*l.* The next two offers, each of 96,000*l.*, were from a German and a local firm respectively. The lowest offer, 67,340*l.*, was from an Italian firm. The construction was eventually confided to a French firm at a price of 81,200*l.* I wish to draw special attention to the fact that, after adding the 33,000*l.* which will now have to be spent in strengthening the bridge, the total cost to the Egyptian Government will only be 114,200*l.*, or nearly 24,000*l.* less than the English offer.

I give another instance in point. The English bridge-builders have at times complained of the system under which they had to prepare their own designs. After much trouble this system was changed. Designs were prepared by the Egyptian Government for certain iron bridges, and tenders invited. At the time the Government thought that the total cost would come to about 7,000*l.* Ten firms competed thus:—

Number.	Nationality.	Estimate.
1.	English	16,619
2.	French	9,690
3.	German	8,670
4.	French	7,840
5.	Belgian	7,528
6.	Belgian	7,440
7.	Belgian	6,840
8.	German	6,682
9.	Belgian	6,520
10.	Belgian	5,807

It can hardly be contended in the face of these figures that

it would have been possible to accept the English offer. I do not, of course, pretend to speak with any authority on a technical matter of this sort, but I cannot help thinking that there must be some mean between the cheap and apparently too flimsy construction of some continental bridge-builders and the very expensive solidity of the English bridges.

I need hardly add that I make these observations not with any wish to criticise the English bridge-builders, who must be the best judge of their own business and their own interests, but rather with a view to bringing certain facts to their notice which may possibly be of use to them in the future.

The following is a copy of the communication from the British Chamber of Commerce of Egypt:—

At a meeting of the committee of this Chamber on the 22nd inst. the following resolutions were passed unanimously, viz.:—

1. That in the interests of British trade in this country, and in order to procure greater publicity and accuracy, it is highly desirable that all Government administrations and departments should advertise their respective requirements, and have all specifications prepared in English as well as in the languages hitherto used, as translations, especially on technical matters, are frequently misleading.

2. That printed or lithographed particulars of the articles to be tendered for be in all cases supplied to intending contractors instead of, as sometimes happens, their having the obligation of themselves copying from one original specification, a fertile source of delay and error; also against payment of a reasonable fee, drawings and samples where these may be necessary.

3. That copies of these resolutions be transmitted to Her Majesty's Minister Plenipotentiary in Cairo.

In bringing these to your lordship's notice, we may state that the practice of the various administrations and departments in the matters referred to varies very considerably, and our resolutions have been intentionally couched in general terms, as favouring, on the one hand, the adoption of an uniform procedure by all the Administrations, whilst avoiding on the other any appearance on our part of singling out for complaint the action of any one in particular.

We permit ourselves to indulge in the hope that your lordship will accord us your powerful support in this matter and cause such remedial measures to be taken as may seem called for by the circumstances of the case. We venture to express the opinion that the removal of every condition acting as a

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price 2*l.*

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRY BEYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty to twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 12*s.*

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year 2*l.* 8*s.* The whole year, when complete, in portfolio, 2*l.* 12*s.*

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

possible deterrent to the tenders of the most important contracting nationality can scarcely fail to be quite as advantageous to the administrations themselves as to the interests which we represent.

Mr. W. F. E. Robertson, the president of the Railway Board, has prepared a memorandum on the resolutions of the British Chamber of Commerce in Egypt as follows:—

I have not been here long enough to be able to give a detailed opinion on this matter, but there are one or two broad features with which I am well acquainted:—

1. As to the necessity for preparing specifications in English as well as in French, I can scarcely believe that the fact of their being in French is any real hindrance to English firms. I, who have passed my time in India, and therefore have had no special connection with foreign trade, find no difficulty in understanding the French documents. Am I, then, to understand that firms who aspire to foreign trade as part of their business are unable to deal with them? There must be hundreds of men in London who can translate such papers, and I know of at least one technological dictionary for English, French and German which gives every technical word in all trades.

2. The English manufacturers have been repeatedly told that their adherence to our system of weights, measures and money is a hindrance to their foreign trade. I can only add my testimony to this effect. It would be a step backwards to encourage the use of English measures on the Egyptian railways.

3. There is a special reason why, in the matter of bridge-building by open tenders, the English firms are at a disadvantage. The continental and American bridge-building firms supply designs as well as the work, and therefore employ very competent specialists, and send up most perfect projects, with all the calculations in full detail.

But as the English firms almost always build to designs which are furnished to them, they content themselves with ordinary draughtsmen, and are consequently at a disadvantage when the tender includes the design. They send in only a general sketch, and the weights are, as a rule, much in excess of those in the more carefully studied projects. Further, a yard which is laid out for a particular style of work can turn it out more economically than one which hardly ever gets two designs alike.

4. The strike clause now so common in English tenders is a hindrance where time is an object.

As to the second resolution regarding an adequate supply of copies of specifications, that is an ordinary matter of business which should be attended to, but which can only refer to very trifling orders and affects all competitors alike. When I know more about the details of the business here I may be able to give some useful hints, but so far as I know there is no reason to suppose that English firms do not receive fair play at the hands of the Egyptian Railway Board. I was much surprised to find that an Italian firm carried off the last bridge contract, and am told that their extremely low labour rates enabled them to do this.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 15374. Daniel Sullivan, for "Weightless window-lifts."
- 15434. Charles Plant, for "Improved flushing-cistern."
- 15443. Francis Crisp, for "Improvements in and relating to dog-fenders."
- 15448. John Charles Attlee Adams, for "Window-fastener."
- 15463. Frederic Dossogne, for "Improved automatic door-closing apparatus."
- 15486. William Lloyd Wise, for "Improvements in windows."
- 15559. Mayer Mamson, for "Improvements in means for securing window sashes."
- 15582. Arthur Martyn and Frederick Walter William Goodsall, for "An improved composite sheet material adapted for roofing lights and other purposes."
- 15637. Alfred Ernest Thomas, for "The manufacture of a fire-resisting brick or material."
- 15649. Thomas Morgan Rees, for "Improved sash-fastener and tightener combined."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

UNEQUALLED FOR ALL DECORATIVE PURPOSES.

Aspinall's

ENAMEL

For Inside and Outside Work.

READY FOR USE.

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

ASPINALL'S ENAMEL can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special
"DECORATOR'S" ENAMEL.

ASPINALL'S ENAMEL. LTD., NEW CROSS, LONDON, S.E.

DO YOU KNOW THE ADVANTAGES OF SANDERSON'S PATENT CAMERA?

FOR ARCHITECTURAL PURPOSES.

IF NOT, READ THE
You will then learn of what im-
It saves time,

SUCCESS. Without Trouble.

FIG. 2.—Taken with Sanderson's Camera, with a reserve of rising front in hand.

TOWER & GATEWAY, CHRIST COLLEGE, CAMBRIDGE.

Taken under Test conditions. A difficult subject, owing to its height and narrowness of the street.

Fig. 2 was taken with SANDERSON'S PATENT CAMERA, the Tripod remaining perfectly level, there being no necessity to tilt it, as is usual with other cameras. No difficulty was experienced in properly composing the subject owing to the great range of the Patent Rising and Swing Front, which reduces the adjustments to a minimum, and does away with the necessity of the orthodox Swing Back.

To accomplish the above it was necessary to raise the lens (a 6-in. Zeiss on a 10×8 plate) above its covering power, but by bringing SANDERSON'S PATENT SWING FRONT into play, which enables the axis of the lens to be directed to the bottom of the plate, perfect covering power and illumination was immediately obtained, as in Fig. 2.

Fig. 3 represents the best possible result that could be obtained with the same lens on a first-class modern Camera, furnished with the usual Swing Back, Rising and Swing Front, &c., these movements having been strained to their utmost limits, and the Tripod tilted to a dangerous degree.

FOLLOWING TEST.
mense value one would be to you.
temper, and plates.

FAILURE. With all the old Troubles.

FIG. 3.—Taken with ordinary camera after straining movements to the utmost.

The above results point to the perfection of SANDERSON'S PATENT CAMERA for work of this description more forcibly than any arguments for or against its principles.

A Descriptive Pamphlet may be obtained on application to the Sole Licensees and Manufacturers—

BANK HOLIDAY ON THE CONTINENT.—For holiday-makers spending a few days abroad, the Great Eastern Railway Company have arranged cheap trips to Brussels and its exhibition by the accelerated Harwich-Antwerp service. Two of the company's finest and quickest twin-screw steamers have been placed on this service, which until September 12 will be on Sundays as well as week-days. On Saturday, July 31, special cheap return tickets, *via* Harwich, Antwerp and Brussels, will be issued to Berne, available for a fortnight. By the company's Harwich-Hook of Holland route, short inexpensive holidays can be spent in Holland and Germany, special facilities being offered for visiting the Hague, Amsterdam, Cologne and the Rhine, &c. Passengers leaving London in the evening, and the chief northern and midland towns in the afternoon, are due at Antwerp and Brussels and the Dutch towns the next morning, and Cologne about noon. Two of the General Steam Navigation Company's fast passenger steamers will leave Harwich on July 28 and 31 for Hamburg, returning August 1 and 4.

LONDON. N.W.

TRADE NOTES.

THE Wrenthorpe schools, near Wakefield, are being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet panels.

WE have much pleasure in announcing that the Smethwick Ventilating Company, of High Park Road, Smethwick, have just supplied their patent cowls for use at the Grand Hotel, Birmingham.

IN our reference to the recent opening of the Lambeth Baths by the Prince of Wales, we omitted to mention Messrs. Matthews & Yates, Limited, ventilating, heating and electrical engineers, of Cyclone Works, Swinton, Manchester, as supplying the ventilating arrangements for these buildings. They have supplied two large electric fans and three electric blowers. The former are arranged for general ventilation, and the latter are fitted to take away the steam from the washing-troughs, &c.

ELLAM'S Duplicator for circular work of every description will be found extremely simple, rapid and cleanly; it is always ready for immediate use, and necessitates no soaking, washing, nor other tedious process. Hundreds of copies can be made from one writing, the last being as good as the first. There is no awkward wheel to use in writing, but a plain steel style. For duplicating typewriting it is invaluable, making copies in any colour ink, which are indistinguishable from original letters written on the typewriter.

BUILDING AND BUILDERS.

MEMORIAL-STONES of a new Independent Methodist chapel were laid on the 15th inst. at Stockingford, Nuneaton.

THE foundation-stones of a new masonic hall on the Crumlin Road, Belfast, were laid on the 10th inst. The site is in every respect a suitable one. It occupies a central position, and is of such extent as to allow of the erection of a very commodious building.

THE foundation-stone of a new building in connection with the Middlesex Hospital, in Nassau Street, has been laid by Princess Christian of Schleswig-Holstein. The new wing is designed to accommodate thirty-six female patients, with the necessary staff of nurses and attendants, and will be provided with all modern sanitary and medical improvements.

At a meeting of the Birmingham baths and parks committee it was decided to recommend the Council to proceed at once with the erection of the promised baths for Small Heath, at an estimated cost of 25,000*l*. The site for the baths has for some time been acquired, and adjoins the Free Library in Little Green Lanes. It is intended to provide first and second class swimming baths, private baths, &c., on the same scale as at Monument Road, and to make similar provision for ladies to that which is made at the other bathing establishments.

THE Guildhall School of Music having entirely outgrown its present habitation, it has been found necessary to secure a site in the rear, on which the Corporation is about to erect an important extension of the school buildings, the foundation-stone of which was laid with much ceremony on Wednesday last by Mr. Deputy Pearce Morrison, chairman of the music committee of the Corporation. The designs for the new building have been prepared by Mr. Andrew Murray, the City surveyor.

THE public health committee of the Edinburgh Town Council on Tuesday resolved to recommend acceptance of separate tenders for each branch of the work at the New City Hospital, amounting to about 89,000*l*. At the last meeting of Council the tender of Mr. Colin Macandrew, amounting to over 93,000*l*., was recommended for acceptance for carrying out the whole of the work, but the matter was recommitted owing to some alleged irregularity in the opening of the tenders.

VARIETIES.

MESSRS. BERRY & CAMPBELL, 17 Ridge Road, Hornsey, have secured an order for heating the new premises of Messrs. Berry & Roberts, manufacturing stationers, Baches Street, N.

THE opening services in the new St. Agnes's Roman Catholic Church, Darmond's Green, West Kirby, were held on the 18th inst.

IN consequence of Mr. R. G. Pinder's severe illness he has been obliged to retire from the partnership of Pinder & Fogerty, architects, as from January 1, 1897. The business will in future be carried on by Mr. J. F. Fogerty.

MESSRS. F. R. & C. H. LUKE, of Edinburgh, have obtained a consignment of slates from North America, the first which has been received in Leith. The importation is one of the consequences of the unfortunate strike at the Penrhyn Quarries.

445 OXFORD STREET, LONDON, W.

A NEW road and railway swing bridge over the River Nene, erected by the Midland and Great Northern Joint Railway Companies at Sutton, Lincolnshire, is now open for traffic. The bridge, which has been three years in construction, cost 80,000*l.*, and replaces the structure built by Robert Stephenson 46 years ago. The new bridge is worked by hydraulic power.

A NEW church, dedicated to St. Olaf, at Balholm Sogne Fjord, Norway, has just been opened for the use of English visitors. The site is vested in the Society for the Propagation of the Gospel. The Rev. J. B. Wilson, vicar of Shooters' Hill, is acting as chaplain.

THE memorial of the late Archbishop Benson in Canterbury Cathedral is to take the form of a canopied tomb beneath the north-west tower, close to the site of the place of burial. In consequence, the tablets bearing the names of the priors and deans of the cathedral, which were to have been placed by the side of the list of archbishops, will have to be erected in the corresponding position in the south-west tower.

A BUILDING of pleasing elevation has been erected at the corner of Carmelite and Tallis Streets for the National Press Agency. It is in French Renaissance style, and the material used for the frontage is a red brick with dressings of warm terra-cotta. At the corner of the street, which contains the main entrance, are two towers surmounted with domes. The ornamental terra-cotta columns and archway which form the entrance support an oriel window. On the first floor is a series of circular bay windows, and on the third floor an arcade crowned with a handsome cornice. The trade entrance is in Carmelite Street, and from this a fireproof staircase leads to the upper storeys. All the floors are of steel and concrete and the columns are protected against fire, whilst hydrants are placed upon every floor, and all the windows facing the adjoining premises are protected with rolled steel shutters. The building is fitted throughout with the electric-light, and great attention has been paid to the sanitary arrangements. The architect is Mr. Edwin T. Hall, F.R.I.B.A., of 57 Moorgate Street, and the contractor is Mr. Howell J. Williams, of Bermondsey.

NEW CATALOGUES.

WE have received a copy of Messrs. Downie & Adams's—of 24 Newman Street, Oxford Street—illustrated price list of incandescent electric-lamps. The numerous designs illustrated give

a wide scope for choice, and display considerable originality and a praiseworthy desire to get away from the old forms which have become monotonous.

MR. JOHN P. WHITE, of the Pyghtle Works, Bedford, is sending out two new catalogues of the chimneypieces and overmantels for which his firm has established a reputation. The illustrations, which are mostly from photographs, give accurate ideas of the appearance of the mantels, &c., when fitted, and these range from the elaborately built-up ingle-nook, suited to the hall of a large mansion, to the simple fitting for a modest bedroom; and the diversity is, of course, greatly increased by the different kinds of wood used, and still more so by the variety of materials which can be employed in the finishing or "fitting-up." Many of the designs are either wholly or in part the conception of artists of acknowledged reputation, Messrs. Voysey, Quennell, Lethaby, Cooper, and others, for instance, having contributed some specially happy notions.

THE DEVELOPMENT OF BRITISH TRADE.

THE Board of Trade have appointed a committee consisting of the following gentlemen, viz. Sir Courtenay Boyle, K.C.B. (chairman), the Hon. Sir H. Stafford Northcote, C.B., M.P., Sir Henry Bergne, K.C.M.G., Mr. S. E. Spring-Rice, C.B., Mr. A. E. Bateman, C.M.G., to consider and advise as to the best means of bringing to the knowledge of the home trades the information furnished by Consuls and commercial Attachés, and by Agents-General and other representatives of colonial Governments and of India as to the supply and demand and other conditions of the markets in their respective districts, and as to the opportunities which they afford for the introduction and development of British trade. Also to report whether it is, in their opinion, desirable that consuls and agents should be instructed to remit home from time to time samples of goods most in demand in such markets, and if they shall be of that opinion, to advise what (if any) arrangements should be made for the exhibition of such samples in London, or for their circulation with the aid of chambers of commerce to the provincial trade centres, with information as to price and other conditions under which they are supplied.

Mr. G. J. Stanley, of the Board of Trade, will act as secretary to the committee.

OBSERVATION TOWER, GREAT YARMOUTH.

ANOTHER permanent addition to the sea-side attractions of Great Yarmouth was made on Monday by the opening of a revolving observation tower erected on the north beach near the Royal Aquarium. The structure is 125 feet in height, it is built entirely of steel and stands on concrete foundations. Including the machinery it weighs about 125 tons. A circular platform built round the tower and constructed to accommodate about 160 passengers is raised to the summit and lowered by means of steam power. As it ascends the platform revolves by electric power at the rate of one revolution in three minutes. There is another platform at the summit to which access is obtained from the revolving apparatus and which is hoisted to an additional height of about 20 feet. From this elevation a magnificent view is obtained. At night the structure is illuminated by fifty incandescent electric lights and by three arc lights. At the base of the tower are spacious bars and dining-rooms. A company of nearly 200 guests were invited to luncheon by the proprietor of the tower, Mr. T. Warwick, in commemoration of the opening. Mr. Warwick presided and was supported by the Mayor of Yarmouth, several members of the Corporation and many of the leading residents of the borough. The party were invited to make the first ascent, which was very satisfactorily accomplished. The Mayor then declared the tower open, and in the course of the afternoon and evening hundreds of visitors ascended it.

SEAFORD BAY.

THE sea is causing so much damage along Seaford Bay that a meeting of public authorities and landowners was held in the County Hall on Monday, the 19th inst., to consider the recommendations of Mr. E. B. Elliot Clark, C.E., for the prevention of denudation of the coast. It is concluded by the engineer that neither a wall without groynes, nor groynes without a wall, nor both without the deposition of shingle in bare places, will be sufficient to permanently resist further and serious encroachment, and any new wall left ungroyned must disappear like that previously constructed from the Newhaven east pier to the Buckle Inn. And the report lays it down as an absolute law that without a shingle bank in front of it, a wall alone along the foreshore of Seaford Bay will not maintain its position. The cause of the railway company's wall falling was due to insufficient shingle, and the portions of the foreshore near the coastguard station provided a good chalk foundation for a wall, which might for some years withstand further encroachments, but the foundation would in course of time be undermined. After pointing out that the manner in which the sea removes the shingle has an important influence on the nature of the design of the sea defences, the report states that in the case of the foreshore between Newhaven and Seaford the natural defence, viz. a sloping beach, is alone insufficient owing to the back land being from 8 to 10 feet below the fall of the beach in many places, and nothing short of a wall will stop the breaking down of the beach crest. The foundations of such wall may rest upon shingle with perfect safety if protected by a shingle bank on the sea-side, and such shingle can only be permanently retained by the construction of groynes. The erection of a wall and groynes alone at places on the beach bare of shingle would be to court disaster. At such bare places it would be necessary to artificially supply such a quantity of beach as will maintain a minimum foreshore in front of a wall during heavy weather.

The report states that the works proposed will consist of a wall along the entire length of the foreshore, to be protected in a line as near as possible with the centre or "full" of the beach, groynes on the foreshore and an artificial supply of shingle in bare places. The wall would for the most part rest upon shingle, and the base of the wall must be carried to such a height as will prevent the water, both from the sea and land springs, accumulating behind it. The wall in front of the Coastguard station to the termination of the cliff near the Buckle Inn will be carried at the base of the cliff so as to give a minimum roadway of 25 feet, and such portion of the wall would be 11 feet in height except at the narrowest place, where the wall would be carried up to the level of the roadway. At the Buckle Inn it would be necessary to raise the roadway for some distance, as the top of the wall will be above the present road. The proposed wall would be carried behind the timber-sheathed bank constructed recently from the Buckle Inn to the Tide Mills, but that portion of the wall may not be required to be erected for the present. The wall would then continue on the full of the beach westward to Newhaven, and form a junction with the existing wall of the railway company. Portions of the wall in the most exposed parts should be faced with flints, and the whole of the remainder of the wall except the foundations, which should be in blocks, should be in mass Portland cement concrete. Shingle should be brought from the east side of the Newhaven Pier to place on the bare places, and such removals of the shingle from the Newhaven Pier would be a positive benefit to

the harbour navigation. The groynes should be placed at a uniform distance of 250 feet apart, except at the east and west ends, where they should be a little further, and they should be of a uniform length of 200 feet at right angles to the general line of the foreshore, and the existing Seaford east groyne should be raised and lengthened. The groynes are estimated to be timber except at certain points where they should be of concrete. In conclusion the report points out that the removal of shingle from the foreshore at any point should absolutely cease, and in regard to the maintenance of the beach wall and groynes some competent person should periodically examine them and report necessary repairs to some authority. Plans, diagrams and estimates accompany the report.

THE NORTHERN POLYTECHNIC.

THE Lord Mayor, accompanied by the Lady Mayoress, last week visited the north of London for the purpose of opening the great hall of the recently-erected Northern Polytechnic in the Holloway Road. The buildings are erected in two blocks, the principal one having an important frontage to the main thoroughfare, while the other frontage is to a street some 200 feet to the rear. These two blocks are connected by a corridor, on the north side of which is the great hall, while on the south side is a plot of ground covering nearly twice the area of the hall, on which are afterwards to be erected the remaining buildings of the institute. Each of the main blocks consists of three floors. In front the ground floor is taken up by the entrance-hall, the principal's-room and the secretary's offices. Above are the drawing office, the engineering department and the physical lecture theatre and laboratory. The second block contains the brickwork shop, the smithy, the carpenters' shop, and the mechanical and chemical laboratories. On the ground floor beside the hall are the gymnasium and a large room to be fitted up as a common room. The great hall is a lofty and finely proportioned building approached from the Holloway Road by means of a handsome vestibule. It measures some 100 feet by 55 feet, will seat over 1,200 persons and is fitted with a large orchestral platform. The roof is elliptical and is covered with fibrous plaster divided into panels with ornamental centres, every alternate panel containing an electric light. When lighted up the effect is very good, and the general illumination excellent. In the daytime the hall is lighted by circular-headed windows, supported by stone columns, each bay containing three windows enclosed in a setting of moulded bricks, whilst the floor is of solid cubes, and has a gradual slope from the entrance to the front of the platform. The gallery has a separate entrance from the Holloway Road, and an emergency exit to the rear. In the front there are three spacious doorways, with three on the north side as exits, leading into a corridor connecting the body of the hall with the orchestra platform. Beneath the platform is a large retiring-room, with other rooms for artistes, speakers, &c., and suitable lavatories are also provided close by. The heating is by steam, conveyed in pipes along channels each side of the hall. The ventilation has been the subject of careful consideration, and is so arranged that fresh air enters the steam-heated channels from the outside, passes warmed into the building, and is drawn away through the ceiling openings to exhaust ventilators on the roof of the hall, whilst an additional supply of fresh air is also obtained by openings the full width of the side windows, forming a sill made of iron. The architect was Mr. Charles Bell, and the work has been carried out by Messrs. Macfarlane Brothers, of Holloway. Messrs. Clarke & Sons, of Moorgate Street, supplied the heating plant, and Messrs. Kite & Co. the ventilating arrangements, and the plaster ceiling was made by Mr. Tanner, Holloway. Something like 40,000l. has been subscribed for the freehold, cost of building, furniture, &c., and of this a great deal has been voted by the various City bodies.

SOCIETY OF ENGINEERS.

A PARTY of the members of the Society of Engineers on Tuesday, July 20, visited the ironworks of Messrs. Easton Anderson & Goolden, Limited, of Erith. Among those present were Mr. G. Maxwell Lawford, president; Messrs. W. Worby Beaumont and J. Corry Fell, vice-presidents; Mr. C. Gandon, past president; Messrs. J. Patten Barber, Joseph Bernays, D. B. Butler and Percy Griffith, members of council; and Mr. G. A. Pryce Cuxson, secretary.

The Erith Ironworks were commenced in 1864 by the firm of Easton, Amos & Anderson, and were laid out by Sir William Anderson, K.C.B., D.C.L., F.R.S., &c., then a member of the firm, and now Director-General of Ordnance Factories. Designed at first as an offshoot from the principal works at the Grove, Southwark, gradual extensions were carried out from time to time, until in 1873 the Grove Works were finally closed, and the machinery and tools moved down to Erith.

The works stand on a plot of ground about 17 acres in extent, and having a frontage of about 800 feet to the river Thames, and the various shops are arranged side by side, the general direction being perpendicular to the river bank, so as to allow of the shop travellers working out on a gantry over barges lying in the river. A railway siding extends from the South-Eastern Railway into the works, so that easy communication both by water and rail is insured. The works are entered through the offices, which are placed at the south-west corner of the property, and which consist of a clerks' office, with manager's and other rooms on the ground floor, and an extensive and airy drawing office occupies nearly the whole of the first floor, the remainder being taken up by estimating and electrical offices; above is a photographic room. The various shops lie between the offices and the river. Commencing from the west side there are covered stores for stock, 95 feet by 43 feet, and sheds for patterns covering an area of 150 feet by 90 feet. Next to these lies a pattern shop 100 feet by 50 feet with a packing store at one end, and an electrical shop in two bays with a store close by. The dimensions of the electrical shop are 150 feet by 100 feet, and room is left at the river end for extensions. East of these shops is a large open yard, and again east of this is the main building, consisting of six equal spans of 43 feet by 600 feet. The two western spans are occupied by an iron foundry 240 feet long, a brass foundry and smiths' shop. The next two spans are given up to machine and erecting shops, the roof in the latter being carried up so as to allow for the erection of lofty engines, the high traveller rails being 39 feet above floor level. The two bays next to these are devoted to boiler and bridge building; beyond this is another extensive yard, in which is a gantry used for the erection of caisson and other large work not easily dealt with in the shops. Beyond this is a field which is utilised as a ground for testing gun carriages and is provided with suitable butts, &c. A large dining hall is provided for the accommodation of the workmen.

The works are well provided with railway tracks and materials can be transferred from one department to another at a low cost.

One of the principal businesses in which the company is engaged is pumping machinery of all sorts. Formerly they used to make large numbers of beam engines for this purpose. Of late years they have been developing the direct-acting inverted triple expansion type, a notable installation being at the new waterworks at Leicester, where three such engines of

large size are to be found. Horizontal 3-throw pumps especially suitable for mine pumping are largely made for driving by electric motors or other means. Centrifugal pumps were made on Mr. Appold's principle for the Great Exhibition of 1851, and the manufacture of all sizes has been continued ever since. Another small though important branch of this trade is hydraulic rams, which were introduced by the founder of the company into this country about 1827, since which time immense numbers have been made and fixed. Of late years a new and very efficient pattern has been adopted as a result of much experimenting.

Cranes and lifting machinery, especially of large sizes, for hydraulic, electric or steam power have been constantly manufactured at Erith. Among notable examples may be mentioned the 160-ton sheerlegs for Sydney Harbour, 150-ton travelling crane for Woolwich Arsenal, and a 150-ton travelling hydraulic crane for Shoburyness. Steam-engines for driving purposes and air-compressors are among the products.

The company have just brought out a new Corliss gear, the invention of their chief draughtsman, Mr. J. Bjornstad, which is very simple and efficient. They have also introduced a new high speed engine (called the "Erith" engine), chiefly for direct driving of dynamos, which promises to have a good future before it.

A special branch of industry which has provided a good deal of work in the last few years is the machinery for the manufacture of cordite. A large quantity of the machinery in use by the Government has been made by the Company, or else at the Royal Arsenal from their designs, and all, or very nearly all, that used by private manufacturers in this country and abroad.

An ingenious machine, invented some years ago by Sir William Anderson, K.C.B., for winding the wire on wire guns, is made by the company, and a number have been supplied to those engaged in this branch of engineering. It is very simple and compact, and yet enables the stress on the wire to be regulated and controlled with the greatest nicety.

The Niagara Pulveriser is a different class of machine from any of the foregoing. As its name implies, it is for the reduction of substances to powder, and can be used for almost any material. It is expected to be much used in the future for crushing quartz in gold-mining operations.

Of late years an extensive electrical department has been added to the works, and which received an additional impetus when the old company of Easton & Anderson, Limited, was

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact, it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

amalgamated with the well-known electrical firm of W. T. Goolden & Co. The principal work in this department is the manufacture of dynamos and motors of all sizes and for both continuous and alternating currents. The newest type of dynamo which is being manufactured is that having four or more poles and slotted armatures with a special drum winding. The difficulties hitherto experienced with slotted armatures have prevented their adoption in spite of the great advantages they possess, but the company have overcome these difficulties, and their new machine, designed by their electrical engineer, Mr. V. A. Fynn, is an undoubted success, and is probably the best machine on the market. They have also introduced lately a new alternator possessing many features of interest, and which has given remarkably good results in efficiency, and, what is of the greatest importance, is almost completely noiseless, thus overcoming one of the great drawbacks in the use of alternate current machinery, the unpleasant hum of the machines.

Electric mining machinery forms a large part of their work. Messrs. W. T. Goolden & Co. were one of the pioneer firms in this branch of industry, and were the introducers of the system of enclosing motors for use in fiery coal-mines, thus rendering the application of electricity more universally applicable than it would otherwise have been; the special applications have been principally made in the direction of electric pumping, hauling, drilling and coal-cutting.

A great number of electric lifts have been made and several are at present in hand, among them one for the South London Electric Railway to take the place of one of the existing hydraulic lifts. The system adopted is one that is patented, and which does away with the cumbersome barrel that is usually used, besides enabling four ropes to be used to suspend both the cage and the balance weights.

The boiler department must not be overlooked. Here all kinds of boilers are made, but principally Lancashire and Cornish land boilers. A specialty in this way is the Cornish multitubular boiler specially designed for export, having a maximum of evaporative power combined with a minimum of shipping measurement, while yet not sacrificing good and economical steam-producing properties. This boiler has met great favour in the South African goldfields, where it was first introduced, and a very large number are at work there at the present time.

The company has in the past carried out some very important works, among which may be mentioned three large

sugar mills for the Khedive Ismail of Egypt, and the waterworks for the cities of Antwerp and Seville, including all the pipe and main laying and the whole of the buildings, reservoirs and other works.

GROVE ACADEMY, BROUGHTY FERRY.

THE extensions which have just been carried out upon this building, and which have been rendered necessary by the steadily increasing number of scholars, complete the original design—although differing from it in certain respects—and constitute it a handsome and well-equipped school. The addition consists in the erection of an east wing, which now takes the site formerly occupied by the old Grove Academy. The entrance is in Church Street—a large, elegant porch giving access to a broad and spacious central corridor. On the ground floor of this wing there are four classrooms, each capable of accommodating from forty to fifty pupils, and so arranged that by means of sliding partitions two of the rooms may, if desired, be transformed into one large apartment. Accommodation has been found on the same level for the rector's room and for a boys' lavatory and cloak-room. On the basement floor a room has been set apart for the use of the assistant teachers; another is to be utilised as the school library, of which the Corbett Library forms a nucleus, while a third apartment is reserved for the janitor. On the first floor are situated the art-room, laboratory and a new music-room. The art-room occupies the north-eastern portion of the wing. lofty and well-lighted both by roof lights and wall windows, it measures about 50 feet in length and 25 feet in breadth, and is divided by a movable partition. The northern portion is set aside for modelling and shading from the east, and the larger section for ordinary class work, being seated for about sixty pupils. The department is equipped in most efficient style, and is furnished with one or two unique features. Behind a sliding blackboard at the back of the lecturer's platform is a sloping lantern screen made of Keene's cement, the lantern used being of the oxy-hydrogen type, and having been purchased by the Police Commission for the use of the technical classes. On one of the walls there is a broad band of Keene's cement 20 feet long and 2 feet 6 inches deep, which will serve the purpose of a permanent blackboard. Then there are cases for the holding of casts, cabinets for the accommodation of canvases, and cupboards for

MCNEILL'S FELTS (Roofing, Inodorous, Sarking, Dry Hair, Damp Course, &c.) MCNEILL'S SLAG WOOL (Silicate Cotton), for Fireproofing and Soundproofing.

AS SUPPLIED TO H.M. GOVERNMENT, WAR OFFICE, ADMIRALTY.

Lists, Samples, and full Particulars free on application to—

MEDALLISTS, ROYAL PHOTOGRAPHIC SOCIETY,
Architectural Photographers & Collotype Printers,
11 LUDGATE HILL AND 3 CREED LANE, E.C.
PRICE LIST AND ESTIMATES ON APPLICATION.

the storage of class diagrams. The south-east end of the first floor is occupied by the new laboratory, with benches for thirty-two pupils, fitted up according to the directions of Mr. Blair, H.M. Inspector of Science and Art. The lecture-table occupies the west end, and the space immediately in front is seated for lecture purposes. The old laboratory has been included in the gymnasium, which is thus much more commodious than formerly; while the old art department is now utilised as a classroom. The boys' playground has also been improved by the laying of granolithic. The architects for the work were Messrs. James Maclaren & Sons.

RAILWAYS IN JAPAN.

THE following report on the progress of railways in Japan has been prepared by Mr. Lowther for the Foreign Office:—

No great advance has been made in construction of Government lines since the report of 1895. The total length of Government lines in operation as then given was 580 miles 69 chains. In the last Government report, issued 1896, the total length opened is given as 593 miles 2 chains, showing an increase of lines opened to traffic of 12 miles 13 chains during the year, and during the same period 34 miles of railway were begun.

In 1895 there were 1,538 miles of private lines open to traffic. This has been increased by 159 miles to 1,697 miles, which gives the total amount actually in operation. Further lines of railway extending over 984 miles have been laid down, but are not yet opened, showing an increase of 470 miles over the previous year of lines laid down. Beyond this charters have been granted for lines to extend over 476 miles.

The most important Government line which has been partly built is that between Hachioji and Nagoya, passing by Shiojiri and thence west by Tajimi to Nagoya. This will be an alternative line to the present main line between Tokio, Osaka and Kyoto, the principal centres of Japan.

The other important line undertaken by the Government is that branching off at Fukushima from the Japan Railway Company's line, which runs north from Tokio, and touching the west coast at Akita, which it may be important some day to be in touch with, and thence running north to Aomori, likewise the terminus of the Japan Railway Company's line. There is further an extension of the line on the west coast from Kanagasaki to Toyama and another further south, running

along the coast from Yonago to Tottori and then inland, joining the main line to Kobe at Himeji; also a small piece of line in Kiushiu running from Yatsushiro to Kagoshima. There is also a short line connecting the dockyard at Kure with the main line. The majority of these lines are only just begun, and will require some years to be completed, as will be seen by reference to the extract from the Budget of 1897-98 quoted below.

Besides this it has been quite lately decided that a line should be undertaken running from Matsumoto northwards by Takayama to Toyama, crossing a pass in the Hida range which is over 6,000 feet high. This railway, if it is built, will be very costly, and it is difficult to see how it can be remunerative, while its strategic value would hardly appear sufficient to compensate for the large outlay. As a further part of this system it has been proposed to connect Gifu with Tajimi on the line from Shiojiri to Nagoya. In Shikoku it is also proposed to build a line from Tokushima to Yawatahama *via* Kochi, and a branch to Susaki.

The lines of the private companies are principally branch lines, connecting the present systems, but there is a tendency to connect the west coast with the east, which up till recently has been absent owing to the difficulties of crossing the mountains, which form the backbone, as it were, of the country.

The total amount included in the Budget 1896-97 to be expended in the construction of new railways is 1,286,666*l.*, and a further provision is made as a continuing expenditure up to 1902-3.

Taking the Fukushima-Aomori line, which will cover a distance of some 300 miles, and the amount set down to be expended on it about 1,110,000*l.*, we arrive at the result that it will cost about 3,700*l.* a mile. In the report of 1895 it was stated that the estimate of the lines to be built was set down at about 3,500*l.* a mile. It is, however, doubtful whether even the larger of these sums will suffice for the purpose, the price of labour having risen since 1895 about 30 per cent.

A further sum of 2,062,450*l.* is also estimated for railways in the Hokkaido, to be spread over twelve years. The doubling of the main Tokaido line, that is from Tokio to Kobe (only very small portions of this being at present doubled), has actually been commenced, but owing to financial considerations it is not expected that it will be entirely open to traffic until 1904. The only difficulty is the tunnelling, for which no provision was made when the line was originally built. The landowners have proved rather obstructive. Nothing has been done towards

connecting the two main lines which run into Tokio, or in the matter of a central station. The question of altering the gauge provoked a good deal of discussion for some time, but appears to have been dropped again now.

Complaints against the management both of Government and private lines have been abundant. The permanent way of the main Government line, it is asserted, does not receive the attention it deserves. No improvement in the velocity of trains has taken place—indeed, rather the reverse. A passenger train now occupies 61 minutes going from Tokio to Yokohama, a distance of 18 miles, and the fastest trains take 45 minutes. In the course of last summer the majority of lines suffered considerably from the floods, and punctuality became the exception rather than the rule.

Two more of the foreign engineers on the Government lines have received notice that their contracts will not be renewed, and their places will be filled by Japanese.

Very little new work on railways has been so far undertaken in Formosa, although the railway between Kelung and Taipeh has been relaid. The locomotives and rolling stock are of such antiquated patterns that they are not of much use, and their quantity is very inadequate. It is the intention of the Government to leave the construction of railways in Formosa to private enterprise, and the Diet has voted a sum of 1,289,250*l.* as a subsidy to the company, equal to 6 per cent. of the capital. This payment is to be spread over fifteen years.

In the report of 1895-96 it was pointed out that British manufacturers had hitherto practically had a monopoly in furnishing rails, locomotives, rolling stock, &c., but that it would require renewed exertions on their part to continue to be the purveyors in this line. Whether from an absence of such energy or from other causes, it is a fact that the tendency has latterly been for other countries to furnish such commodities.

In September 1896 a tender was granted to Messrs. Mitsui by the Government Railway Department for 13,000 tons of rails. They subsequently placed the order with Messrs. Carnegie, of Pittsburg, at a price alleged to be 10 per cent. under that quoted by English makers. Some time previous to this contract being let there existed a syndicate of American rail-makers to keep up the price of rails for home consumption and also for export. English makers advanced their prices in sympathy with this movement, but it is asserted that, in spite of the syndicate, rails were exported by certain makers in America at prices lower than those quoted as the syndicate prices, and thus many orders went to America, but,

with the advent of the McKinley régime and the prospect of increased tariffs, it is not improbable that Japanese orders may again be placed in England.

The difficulties surrounding the system of tender have, to a certain extent, militated against orders being placed in England. The conditions of tender, purchase and contract have latterly been radically altered. Up to the end of 1895 Government requisitions and indents were sent *en bloc* to London, and the materials required were purchased by Government agents under very rigid inspection and supervision. Since the end of 1895 all requisitions have been issued from the head railway office at Shinbashi, and this will probably continue to be the system adopted. In most cases a nominal fee is charged for specifications, and the following conditions must be complied with:—1. Applicants for specifications and forms of tender must be Japanese subjects. 2. They must give proof of having been in business for at least two years. 3. They must satisfy the departmental authorities that they are able financially to carry out the contract. 4. With the tender, an accompanying deposit of 6 per cent. of the amount of the tender must be made. 5. In the event of the tender being accepted, such deposit must be increased to 10 per cent.

These stringent regulations naturally reduce competition within extremely narrow limits; in fact, only some three or four Japanese firms can compete successfully. Take, for instance, the contract for rails referred to above, which would probably amount to 90,000*l.* The required deposit would be 9,000*l.*, which is practically abstracted from the capital of a business firm during the time the contract is being executed, probably from nine to twelve months, and this sum may also be forfeited under certain conditions.

In the report of 1896 it was also pointed out that a very large proportion of the locomotives on Japanese railways were of English make. The proportion appears to have been at a comparatively recent date—English, 224; American, 6. Some of the latter were purchased in 1890, but did not give satisfaction, the finish being unsatisfactory and the consumption of coal greater than on the English engines. However, some more were ordered in 1894, with a like result. With this experience, it is not to be wondered at that the Japanese should prefer to purchase English-made locomotives, but we do not have a monopoly in this line.

In October 1896 tenders were considered for eighteen locomotives. Three Japanese firms and one foreign (French) firm tendered through a Japanese subject. The locomotives

THE WELL-KNOWN FRIEZE, ENTITLED "THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

**A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.**

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial Field.* "They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced at subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman.*

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates

were to be of English make, six well-known manufacturers being selected. The contract was let to the French firm at 48,000*l.*, while the amount of other tenders ranged from 7 per cent. to over 50 per cent. higher. Subsequently, owing to the specified English makers being so busy, and the contractor, therefore, unable to fulfil the necessary conditions as to delivery within a specified date, the contract was thrown up, and the deposit money, 10 per cent., forfeited.

Now fresh tenders for the same eighteen locomotives are being considered, but the number of approved makers has been increased to nine. Probably owing to English makers finding it difficult to adhere exactly to a special date of delivery, which, in view of the fact that a considerable impetus has latterly been given to railway enterprise in Japan, is rather short, orders are now going to America. Some sixty or seventy locomotives have recently been ordered in America by the Government railways and the Japan Railway Company.

The building of locomotives at Kobe, in Japan, continues, but facilities do not exist for building on a large scale. The total number built in those works now reaches nine. The last one turned out is a goods engine similar to those used on the London and North-Western Railway. All the locomotives have been built at Kobe under the superintendence of Mr. R. F. Trevithick, M.I.C.E.

The Government apparently find the system of importing the material and setting up here satisfactory, as the material for six engines is about to be ordered from England and built in Tokio. The cost of the locomotive referred to above as having been built at Kobe amounted to 18,237 *dols.*, or about 2,026*l.* This may be considered the total cost of the locomotive ready for traffic, but no estimate is made for wear and tear of machinery or interest of buildings, for which about 2,000 *dols.* must be added, bringing the cost of the engine to 2,248*l.*

In 1894 twelve locomotives somewhat similar to that mentioned above were purchased from Beyer, Peacock & Co., the cost of which was 2,680*l.* 5*s.* 10*d.*, as against 2,248*l.* mentioned above, an advantage in building in Japan of over 400*l.* per locomotive.

Under the most favourable circumstances it is not likely that an English locomotive could be imported and placed in Kobe station ready for traffic under at least 2,200*l.* The foreign advisers of the Railway Department have frequently pointed out to their employers the advantage to be derived from building in Japan, but at present insufficient facilities exist for turning out any large number of locomotives.

PATENTS.

This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 15932. Lewis Elstein, for "An improved means for ventilating rooms, buildings and the like."
- 15998. Moses James Adams, for "Improvements in closets."
- 16005. David Booth, for "Improvements in or in connection with taps for sanitary or drain-pipes."
- 16007. Frederick John Borland and Edwin Moorhouse, for "Improvements in or connected with electrical ceiling roses."
- 16017. John Yeadon, for "Improvements in or appertaining to vessels for obtaining water or other liquids for washing floors or the like."
- 16027. Alfred Grayson, for "The double dovetail fixing-bricks."
- 16056. George W. Meserve, for "Improvements relating to the plastering of walls."
- 16079. Richard Lloyd Gurden and Harry Williams, for "Improvements in or relating to brick-making machines."
- 16103. Edward William Ives, for "An improved method of extracting the precipitated sludge from the bottom of flat-bottom tanks used in the purification of sewage and manufacturers' waste waters."
- 16183. Adamson George Wild, for "Improvements in hinges."
- 16235. William Phillips Thompson, for "Improvements in window-sashes."
- 16260. Emile Paul Abel Huguss, for "Improvements in cement building materials."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from 1/4th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.,
39 UPPER THAMES STREET, LONDON, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

BOOTLE.—July 31.—Competitive plans are invited of a technical school to be erected at the corner of Balliol Road and Pembroke Road, at a cost not exceeding 15,000*l.* Premiums of 50, 30 and 20 guineas will be awarded for the designs adjudged of sufficient merit, and placed first, second and third in order respectively. Mr. J. H. Farmer, town clerk, Town Hall, Bootle.

CONTRACTS OPEN.

ABERDARE.—Aug. 6.—For building two shops in Cardiff Street. Mr. T. Roderick, architect, Clifton Street, Aberdare.

ABERGAUENNY.—Aug. 6.—For alterations and additions to the British schools. Mr. E. A. Johnson, architect, Abergaenny.

ALNWICK.—Aug. 3.—For erection of a pair of houses, Swansfield Park Road. Mr. Wm. Robson Hindmarsh, jun., architect, Alnwick.

BRISTOL.—Aug. 2.—For new boys' department to Bishop Road schools, Horfield, and for extensions to existing buildings. Mr. W. V. Gough, architect, 24 Bridge Street.

BRISTOL.—Aug. 2.—For plumbers' work to new boys' department of Bishop Road schools, Horfield, and for extensions to existing buildings. Mr. W. V. Gough, architect, 24 Bridge Street, Bristol.

CARDIFF.—Aug. 4.—For an extension of central arcade between St. Mary Street and the Hayes. Mr. Edwin Seward, architect, Queen's Chambers, Cardiff.

CARLISLE.—Aug. 2.—For erection of a public hall at Kirkpatrick-Fleming. Mr. Geo. Dale Oliver, architect, 5, Lowther Street, Carlisle.

CARMARTHEN.—Aug. 6.—For building a new farmhouse at Croft. Mr. T. P. M. George, Rhydgarnwen.

CHESHIRE.—Aug. 4.—For erection of a caretaker's house at the Nurseries, near Sale. Mr. R. D. Callison, estates superintendent, Town Hall, Manchester.

CHESTER.—Aug. 9.—For erection of an infectious diseases hospital, Sealand Road. Mr. H. Beswick, architect, 17 Newgate Street, Chester.

CORK.—For erection of roof, flooring upper portion of dwelling-house, building portion of front wall, cementing front, with new frames and sashes, at 6 North Mall. Mr. K. D. Roche, architect, Marlborough Street, Cork.

CORNWALL.—Aug. 7.—For erection of a new school and appurtenances, for the St. Stephen's-in-Branwell School Board. Mr. Sampson Hill, architect, Redruth.

DEAL.—Aug. 4.—For alterations and additions to Deal and Walmer Dispensary. Messrs. Fry & Gardner, High Street, Deal.

DORSET.—Aug. 9.—For erection of a new infants' school at Heatherlands, for the Kinson (U.D.) School Board. Mr. Herbert Wm. Dibben, clerk, Matlock House, Upper Parkstone.

DOVER.—Aug. 10.—For erection of two iron ladders and landings, &c., and for alterations required to four windows at the female hospital, the workhouse. Mr. Eugene Carder, clerk, 17 Market Square, Dover.

DURHAM.—Aug. 24.—For enlarging and reseating Wesleyan chapel, Trimdon Grange. Mr. W. R. Woodhead, Trimdon Grange.

EAST STONEHOUSE.—Aug. 3.—For alterations to East Street Schools, for the East Stonehouse School Board. Mr. H. J. Snell, 13 Courtenay Street, Plymouth.

ECCLES.—Aug. 9.—For erection of pavilion in the Eccles recreation ground. Mr. Geo. Wm. Bailey, town clerk, Town Hall, Eccles.

ESSEX.—Aug. 10.—For extension of drainage of the workhouse, and also for reflooring one room in workhouse, for the Guardians of Lexden and Winstree Union. Mr. John Ennals, surveyor, Copford.

EXMOUTH.—For erection of the railway hotel. Messrs. Kerley & Ellis, architects and surveyors, Exmouth.

FALMOUTH.—Aug. 13.—For reseating, renovation and decorating of the Wesleyan Chapel, Flushing. Mr. Horace W. Collins, architect, Penryn Street, Redruth.

GALWAY.—Aug. 10.—For alterations to provide accommodation for jurors and witnesses and public offices in the county-court house. Mr. James Perry, county surveyor.

GREAT YARMOUTH.—Aug. 6.—For erection of fourteen cottages, Stone Road, Southtown. Mr. Chas. G. Baker, architect, Town Hall Chambers, Great Yarmouth.

GREAT YARMOUTH.—Aug. 11.—For erection of six cottages, Church Road, Gorleston. Mr. Wm. B. Cockrill, architect and surveyor, Gorleston.

GREETLAND.—Aug. 2.—For erection of schools at Greetland. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HEREFORD.—Aug. 6.—For erection of a laundry works at Bodenham Road. Mr. A. Lovesey, 2 Offa Street, Hereford.

HEREFORD.—Aug. 7.—For erection of residence in Hampton Park. Messrs. Nicholson & Hartree, architects, Hereford.

HEYWOOD.—Aug. 2.—For reseating and other alterations at the Unitarian church, Heywood. Mr. J. E. Mills, architect, Market Place, Heywood.

BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

IPSWICH.—For additions to Rose Hill Schools, for the Ipswich School Board. Mr. E. F. Bishopp, architect, 32 Museum Street, Ipswich.

IPSWICH.—Aug. 4.—For addition of a wing and the execution of other work at the East Suffolk and Ipswich Hospital. Mr. Edward Fernley Bishopp, architect, 32 Museum Street, Ipswich.

IRELAND.—Aug. 12.—For erection of a dispensary and dispensary residence at Folly Hill, Aghalee. Mr. Edwin Jas. Donaldson, clerk, Lurgan.

IRELAND.—Aug. 14.—For erection of upper part of tower and spire at the Catholic church, Clones. Mr. William Hague, architect, 50 Dawson Street, Dublin.

JARROW.—Aug. 7.—For building wall and alteration to sheds at Willington Quay. Mr. J. Petree, borough surveyor, Jarrow.

KENDAL.—Aug. 3.—For alterations to Garsdale Church. Mr. John F. Curwen, 26 Highgate, Kendal.

LEEDS.—For erection of four terrace houses (stone), Apperley Lane, Rawdon. Mr. Fred. Mitchell, architect and surveyor, 71 Albion Street, Leeds.

LIMERICK.—Aug. 3.—For erection of a water-closet in Bank Place. Mr. W. E. Corbett, city surveyor, 28 Glentworth Street.

LONDON, E.C.—For rebuilding Rose and Crown public-house, Bartholomew Close, E.C. Messrs. Dear & Winder, architects, 119 Great Russell Street, Bloomsbury, W.C.

LONDON.—Aug. 10.—For erection of infirmary for accommodation of 800 patients on land at the late Small Pox Hospital, Highgate Hill, Upper Holloway. Mr. Edwin Davey, clerk, Guardians' Offices, St. John's Road, Upper Holloway, N.

LONDON.—For alterations at the Three Tuns, Fann Street, Barbican. Mr. G. Silvester, surveyor, 46 Strand.

MIDSOMER NORTON.—Aug. 5.—For erection of a retaining wall and other works near Welton Station. Mr. W. F. Bird, Market Hall.

MORECAMBE.—Aug. 2.—For erection of a detached villa at Cross Cop. Mr. James Marshall, architect, Back Crescent, Morecambe.

NEWCASTLE (CO. DOWN).—Aug. 2.—For erection of three cottages in Newcastle, co. Down. Mr. Samuel Gelston, 133 Royal Avenue, Belfast.

NEWHAVEN.—Aug. 9.—For construction of chimney shaft 120 feet high at the Sussex Portland Cement Works, Heighton. Address, The Manager.

NEW TREDEGAR (MON.).—Aug. 3.—For building forty houses on Cwmsyflog Farm. Mr. Geo. Kenshole, architect, 26 Duffryn Terrace, New Tredegar.

PERSHORE.—Aug. 3.—For repairs and painting of the workhouse infirmary. Mr. Joseph Martin, clerk, Union Offices, Pershore.

PETERBOROUGH.—For erection of a pair of villas in Fletton Avenue. Mr. James Ruddle, architect, Boroughbury, Peterborough.

PETERBOROUGH.—For erection of a house, shop and bakehouse, Buckle Street. Mr. J. G. Stallebrass, architect, Peterborough.

PLYMOUTH.—Aug. 3.—For alterations at the Corn Exchange Hotel. Mr. B. Priestley Shires, architect, Central Exchange, Plymouth.

PLYMOUTH.—Aug. 10.—For the enlargement of the passenger station and for other works at Plymouth (Millbay), for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, London.

PONTEFRAC.—For erection of a villa residence at Ferrybridge. Messrs. J. Holmes Greaves & Co., architects, Cornmarket, Pontefract.

PONTEFRAC.—Aug. 7.—For erection of a lodge at Fryston. Mr. J. G. Kelly, West View, Pontefract.

POOLE.—Aug. 3.—For alterations and other works at the workhouse, Longfleet. Mr. H. F. J. Barnes, architect, Poole.

PONTYPOOL.—Aug. 18.—For alterations to existing workhouse buildings, new steam laundry, new infectious diseases hospital and mortuary, aged couples' home and other works. Messrs. Lansdowne & Griggs, architects, Metropolitan Bank Chambers, Newport, Mon.

SCARBOROUGH.—Aug. 13.—For erection of eight dwelling-houses at the coastguard station. The Director of Works' Department, Admiralty, 21 Craven Street, London, W.C.

SCOTLAND.—Aug. 2.—For erection of a tower, dwelling-houses, engine-house, &c., at Blackhead, near Portpatrick. Mr. David A. Stevenson, engineer, 84 George Street, Edinburgh.

SHEFFIELD.—For alterations to Heeley and Sheffield House, Gleadless. Mr. W. T. Rhoden, architect, Buckingham Chambers, St. James's Street, Sheffield.

THE

TRADE NOTES.

THE St. Augustine's Schools, Bristol, are being warmed and
ventilated by means of Shorland's patent Manchester grates.

ELECTRIC NOTES.

THE cleaning and lighting and electric-lighting committees
of the Edinburgh Town Council have resolved to recommend
the Magistrates and Council to authorise the introduction of
the electric light into Portobello.

THE first installation of electric light for public lighting
purposes in the Isle of Man was recently inaugurated at
Onchan, the enterprising town to the north of Douglas. Five
arc lamps of 1,000 candle-power each have been erected at
different points in Onchan in the leading thoroughfares, and
the light is supplied from the Douglas generating station. The
lighting is eminently satisfactory.

At the Wakefield City Council meeting Councillor Bolton
reported that operations at the electric-light works at Calder
Vale were going on satisfactorily. The chimney shaft was
143 feet above the ground, and 37 feet had still to be added.
The preparation of the engine beds was so far advanced that
Messrs. Fowler, of Leeds, would soon commence fixing the
engines, one of which would be in readiness in time to enable
the Corporation to carry out their agreement with the West
Riding County Council for supplying the electric light to their
offices.

NEW PARLIAMENTARY BUILDINGS, SYDNEY, NEW SOUTH WALES.—FIRST FLOOR PLAN.—SECOND FLOOR PLAN.—GROUND FLOOR PLAN.—BASEMENT PLAN.

BUILDING AND BUILDERS.

A CHURCH to seat 500 is about to be erected in St. Mark's parish, Newport.

It is intended to erect a church in Clydach, Swansea Valley, at a cost of 2,800*l*.

A CHURCH is to be erected at Rhosrobin, a mining district near Wrexham, at a cost of about 1,300*l*.

A WESLEYAN chapel is about to be erected at Hoylake, Cheshire, at a cost of 2,000*l*.

A NEW Primitive Methodist chapel is about to be erected at Lymm, Cheshire, at a cost of 1,300*l*, and a new chapel and school premises at St. Helens.

THE tenders for constructing the proposed new Congregational church in the north-west ward at Scarborough have been decided upon. The seating will be for 500 worshippers.

THE foundation-stone was laid on the 24th inst. of a new church at North Brixton which is to replace Christ Church, which is found to be beyond repair. The new building, with parochial hall and infants' school, will cost 17,300*l*.

THE postal authorities have agreed upon a site for a new post office at Stranraer. It is in Charlotte Street, and the building which is standing thereon will be pulled down, and new premises erected to plans approved by the postal authorities.

THE foundation-stone of a synagogue at Leicester has been laid by Sir Israel Hart, past mayor, who was the first Jew to be elected to that office, and a commemoration-stone in honour of the Queen's Diamond Jubilee was also laid by his worship the present Mayor.

A PHILANTHROPIST who prefers to remain anonymous offers to contribute 10,000*l*. towards the provision of a large

general hospital for the parishes of Lambeth, Camberwell and Battersea. It is stipulated that the contract for the erection of the hospital shall be entered into not later than August 1899, and that no medical school shall at any time be formed or carried on in connection with the institution. The idea is that the control and administration of the hospital shall be vested in the three parishes referred to.

AT a public meeting held at the end of last January in Portsmouth it was decided to celebrate the Diamond Jubilee by the rebuilding of the hospital, and to raise within the year, if possible, 10,000*l*. This was estimated to be sufficient to pay for the first two blocks, which would give accommodation for eighty patients. Subsequently it was ascertained that the proposed work could not be carried out for less than 15,000*l*, but in less than six months a sum of 276*l*. in excess of the 15,000*l*. has been raised.

VARIETIES.

THE designs of Mr. A. M. Butler, architect, 16 Finsbury Circus, have been adopted for the new higher-grade schools to be erected at Wood Green for the Tottenham School Board.

PRINCESS HENRY OF BATTENBERG will to-morrow (Saturday) lay the foundation-stone of a new block at the Ventnor Consumption Hospital. The new building is being erected as a memorial to the late Prince Henry of Battenberg.

It is proposed to build an English church in Lucerne as a memorial of the sixtieth year of the reign of the Queen. The cost of the site and the building will be 7,000*l*.

A NEW bridge in King's Road, St. Pancras, over the Midland Railway, was opened on the 22nd inst. The foundation stone was laid a few months ago by Mr. Wetenhall, J.P., L.C.C., the chairman of the vestry.

THE residence of Mr. E. de Lisle, ex-M.P. for the Loughborough division, was struck by lightning during a thunderstorm which recently broke over Charnwood Forest. The north wing of the mansion was wrecked.

AN explosion occurred at the Electrical Storage Accumulator Works at Woking. The highly inflammable character of the building rendered it absolutely impossible to save any portion, though the fire was kept from spreading. A large quantity of celluloid was destroyed, together with the machinery. A number of workpeople will be thrown out of employment. The

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact, it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

origin of the fire is unknown. The damage is estimated at 10,000/.

THE British Archæological Association meets at Conway for the week from August 19 to 25. Visits will be paid to St. Asaph, Carnarvon, Bangor, Beaumaris, Gwydir, Llandudno and Gloddaeth, the residence of Lady Augusta Mostyn. The Lord Mostyn will be the president of the meeting. Lacy Paget, Mr. de Gray Birch, Mr. C. H. Compton, Mr. Lynam and Mr. Meredith Hughes will contribute papers.

At the Mart, Tokenhouse Yard, E.C., Messrs. Fox & Bousfield, by order of the Ecclesiastical Commissioners for England, submitted on the 22nd inst. for public auction the freehold estate, with possession, forming the site of the late Church of St. Michael, Wood Street, Cheapside, containing an area of 3,700 superficial feet. The bidding was of a brisk character. It started at 18,000/., and proceeded by bids of 100/., and 500/., until the sum of 31,600/., at which price the property was knocked down.

THE Blackpool Tower was on the night of the 22nd instant the scene of a conflagration which spread dismay among the holiday visitors to the "Brighton of Lancashire." Messrs. Maxwell & Tuke, architects, of Manchester, who have since examined the tower and buildings, state, however, that no damage has been done to the main structure or entertainment portion of the buildings, the fire being confined simply to the three landings above the 380 feet platform, where certain wood-work has been destroyed, and where the heat fused the cables, causing the two balance weights which assist the hydraulic engines to raise the lifts to fall down their track inside one of the legs of the Tower.

THE new parish church at Nairn was opened on the 23rd inst. The site is at the corner of Seabank Road, at the west end of Nairn, and the edifice has been erected at a cost of 9,000/., by voluntary subscriptions. The style of architecture is of the Early English transition period, and is from plans by Mr. Starforth, Edinburgh. Its main external feature is a massive square tower about 100 feet high, in which is the main entrance. On either side of the main tower are two smaller towers, which give access to the galleries. Two large gables on either side give massiveness and beauty to the structure. The stone used is the old red sandstone of the district, and where the masonry is plain it consists of bold hammer-dressed rubble, which looks well. The interior of the church is transeptal in design, but has the unique feature of being really

circular in form. Two handsome memorial windows have been presented to the church.

THE Battenburg Memorial Chapel in St. Mildred's, the parish church of Whippingham, Isle of Wight, is nearly completed. The base of the new sarcophagus is composed of dove marble, and the panels above, of pure white statuary marble, bear the arms and the orders of the prince and princess. The top is adorned with appropriate scriptural texts and the Latin words "In te Domine spero." The altar-table, constructed of dove and statuary marble, is approached by polished steps. Above the table is to be erected the figure of an angel with outstretched wings, which will stand about 8 feet high and occupy the major portion of the east end. Princess Louise, Marchioness of Lorne, is now engaged upon this work.

IN excavating the foundation of new buildings in Northgate Street, Chester, the workmen have unearthed further relics belonging undoubtedly to the period of the Roman occupation. The most important is the base of a column similar to that previously found, but in a line with it from east to west. This seems to prove that the original building must have faced either north or south and not have run in a line with the existing street. A fragment of a Roman altar was unearthed, bearing the letters G E N I O . . . on the first line; on the second V V . . . ; and on the third T V E T. So far as can be judged it is a portion of an altar dedicated by a veteran of the 20th Legion, Valeria Victrix. An interesting relic has also been found in the form of a piece of carving with a human face, surmounted by a Roman headdress cut on it. From the shape and bedding of the stone it is believed that it had been one of the corbels of the building. About seventy copper coins have also been found belonging to the early part of the present century.

BUILDERS' BENEVOLENT INSTITUTION.

THE fiftieth annual meeting of the Builders' Benevolent Institution was held on Thursday, July 22, at the offices, 35 Southampton Row, Bloomsbury. Mr. W. Scrivener (vice-president) occupied the chair, supported by Messrs. Thomas Stirling, Thomas Hall, E. S. Rider, C. Ansell, F. Foxley, E. V. New and others.

Major Brutton (the secretary) read the annual report, which stated that the income during the past year had been sufficient

THE NEW EXPANDED METAL

Mesher from 1/8th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

for the maintenance of the pensioners, and, believing it would meet with the approval of the subscribers, the committee admitted the whole of the thirteen eligible candidates to participate in the benefits of the Institution. Although the large increase in the number of pensioners entailed much responsibility, the committee were of opinion that the necessary income would be forthcoming to meet the increased expenditure, particularly as the advanced age of the applicants required immediate relief. Much of the success of the year had been owing to the energy of the president, Mr. Henry Holloway, to whom the committee offered their hearty acknowledgments and gratitude. The subscribers were asked to kindly bear in mind that the present was the fiftieth year since the foundation of the charity—indeed, its jubilee—so that a largely increased contribution might be hoped for on so special an event. The committee desired to offer their thanks to the stewards of the annual dinner and to the honorary auditors. Much regret was felt at the loss by death of Sir William Lawrence and Sir James Clarke Lawrence, Bart., both past presidents of the Institution, the latter being also a trustee. The committee announced that Mr. Charles Wall would be the president for the ensuing year, and that the annual dinner would take place in Carpenters' Hall on Thursday, November 25.

On the motion of Mr. New, seconded by Mr. Foxley, the report and balance-sheet were unanimously agreed to.

Mr. T. Stirling next moved:—"That the committee be empowered to give temporary relief in cases of urgency to selected but unsuccessful candidates for the charity, to an amount not exceeding 5% to any one candidate." At the close of the elections there had often been a good deal of disappointment among the unsuccessful candidates, and it had been considered that this would be a generous course to pursue.

Mr. New seconded the resolution, which was agreed to *mem. con.*

On the motion of Mr. Hall, seconded by Mr. Stirling, a cordial vote of thanks was passed to Mr. Henry Holloway for his kind support and services during his year of office.

Thanks were also given to the trustees, to the treasurer, Mr. George Plucknett, J.P., and to the committee, the retiring members being reappointed, with the addition of Mr. Henry Holloway. Thanks were also passed to the auditors.

Mr. Stirling proposed Mr. Charles Wall as president for the ensuing year, which was seconded by Mr. Hall, and carried by acclamation.

A vote of thanks to the chairman closed the proceedings.

THE KILLIN SEWAGE WORKS, PERTHSHIRE.

THIS popular resort is now drained by a new system of sewers, provided with manholes, flushing tanks and all the most recent sanitary improvements. The sewage is treated by the "International" process in works situated to the south of the railway in a park owned by Lord Breadalbane. The effluent passes by an open concrete channel into Loch Tay. There is no pumping; the sewers are designed to deliver the sewage to the purification works entirely by gravitation. Great satisfaction is felt at the completion and success of this installation. The works are of a model character and beautifully situated in this charming locality on the shores of Loch Tay, which is now in the important matter of drainage placed in the first rank in Scotland.

The completion is to be commemorated by a ceremonial today, when the works will be formally declared open by the Convener of the County Council of Perth, Colonel Hope Drummond, accompanied by the members of the western district committee of Perthshire County Council.

The works have been designed and carried out by Mr. Woulfe Brenan, C.E., of Ovan; the contractor was Mr. Bremner, of Fortingall, Aberfeldy; and Mr. R. Cameron, of Edinburgh, was clerk of works.

CITY AND GUILDS INSTITUTE.

AT a meeting of the council of the City and Guilds of London Institute, held on July 26, the diploma of "Associate of the City and Guilds of London Institute" was conferred on the following matriculated students who have this year successfully completed a full course of instruction at the City and Guilds Central Technical College:—*Civil and Mechanical Engineering*—H. W. Hanbury (Siemen's medal), J. E. Cornish, W. P. Unwin, H. D. Drury, J. B. Willis, M. Jacomb-Hood, J. C. Malin, A. W. Lewis, R. S. Solomon, H. J. Williams, T. Rich, C. E. Shackle. *Applied Physics and Electrical Engineering*—E. W. Marchant, B. Sc. (Siemen's medal and premium), W. L. Waters, F. S. Spiers, B.Sc., F. Twyman, E. G. Brown, S. S. Grant, C. Lean, H. M. Kirkby, R. M. Sayers, W. E. Barker, W. M. Nelson, S. L. Smith, H. R. Mott, T. A. Kerr. *Applied Chemistry*—F. Silvester, G. Lessels, A. N. Crosskey, F. J. Jessop, H. J. Winch, E. R. Nind, E. W. Devas.

THE JUBILEE OF THE INSTITUTION OF MECHANICAL ENGINEERS.

ON Tuesday the members of the Institution of Mechanical Engineers met in the Technical Institute, Birmingham, when Mr. E. Windor Richards delivered the following address:—

He said the Institution, which in 1847 commenced in this city its life of usefulness, that day revisited its birthplace to celebrate the fiftieth year of its existence. He expressed his high appreciation and grateful acknowledgment of the immense influence for good which had been exercised by Her Majesty throughout the sixty years of her glorious and beneficent reign, and during which their Institution had so greatly prospered, and said that an address had been presented by the Council to the Queen-Empress. He recalled to members the original ideas of those who initiated the Institution, which were the following:—To promote the science and practice of mechanical engineering and all branches of mechanical construction, and to give an impulse to inventions likely to be useful to the members of the Institution and to the world at large; and also to enable mechanical engineers to meet and to correspond, and to facilitate the interchange of ideas respecting improvements in the various branches of mechanical science, and the publication and communication of information upon such subjects. Had they attained the object for which the Institution was formed? To answer this vital question it would be necessary for him to review rapidly for their consideration some of the work done by the Institution during the times of the several presidents, and to give some brief notes on the origin and history of the Institution. On Wednesday, January 27, 1847, a general meeting was held at the Queen's Hotel, Birmingham, for the purpose of forming the Institution. Mr. McConnell, of Wolverton, occupying the chair, read a list of gentlemen who had sent answers to a circular inviting their co-operation and their consent to become members of the Institution. On his proposal, seconded by Mr. Buckle, it was resolved "That the Institution be established and composed of the gentlemen whose names he had announced." Mr. George Stephenson was elected the first president. He sketched the proceedings at these early meetings of the Institution in Birmingham, and went on to speak of the various presidents from the time of the inauguration of the Institution, of the inventions they had made, and of their effect upon the

various industries to which they were applied. During 1848 and 1849 the meetings were held in the Philosophical Institution, Cannon Street, Birmingham, and it was there that the president occupied the chair for the last time on Wednesday, July 26, 1848, when his paper on the fallacies of the rotary engine was read and discussed. His death took place only seventeen days later. In 1850 a house was taken in, Newhall Street, where for fourteen years afterwards the meetings were mostly held. The proposal of holding the summer meeting of the Institution in the leading centres of engineering throughout the kingdom originated in 1856 with Mr. James Fenton, who was consulting engineer to the Lowmoor Iron Company from 1851 to 1863; and through his energetic exertions the proposal was realised in September of the same year, by a meeting held for the first time in Glasgow, under the presidency of Mr. Joseph Whitworth. As one result of this new step the number of members in the Institution, which for the seven preceding years had remained at almost a dead level of just over two hundred, now began at once to increase at a rate of growth which had since continued to progress steadily up to the present date, when they had 2,360 members. During the presidency of Sir Joseph Whitworth in 1856-57 Henry Bessemer's discovery was announced, by which it was claimed that by blowing cold air into and through molten metal malleable iron and steel could be produced without fuel. This statement startled the whole engineering and metallurgical world, and was received by manufacturers of wrought iron with mingled feelings of panic and unbelief. The production of Bessemer steel had now attained to a yearly quantity of nearly 2,000,000 tons of ingots in Great Britain, and of 5,000,000 tons in America. Sir Henry Bessemer was now in his eighty-fourth year; and he might be justly proud that by his invention, conceived and matured during the reign of her Majesty, the world was producing about 10,500,000 tons of Bessemer steel annually. Sir William Siemens, president 1872-73, and whose name was associated with that of his brother Frederick as inventors of the regenerative system for melting iron and steel, read a paper in Birmingham in July 1862, on the gas furnace. No one could possibly have foreseen the really marvellous developments brought about by this invention, by which the process of steel-making known as the Siemens or ore process, and that of Siemens-Martin or pig and scrap process, were made possible. At the time of his presidency of this Institution twenty-five years ago the production of Siemens-Martin steel was 40,000 tons for the

whole of 1872, and the price of ship-plates about 17 $\frac{1}{2}$ per ton; whilst last year the production in Great Britain had reached nearly 2,354,000 tons, the price of ship-plates being brought down to 5 $\frac{1}{2}$ s. to 5 $\frac{1}{2}$ 10s. per ton. The total production of open-hearth steel in all countries in 1896 was nearly 7,000,000 tons. In 1879 the quantity of ship-plates made by this process was 20,000 tons, as compared with 9,000 tons made by the Bessemer process, and it was at that time predicted that open-hearth steel would take possession of the field for ship and boiler plates, while the Bessemer process would supply the great bulk of the material required for railway purposes. It would appear as if this prophecy would soon be realised, for they found that in 1896 the production of plates and angles by the Siemens process was about 1,000,000 tons and by the Bessemer about 60,000 tons, while by Bessemer about 1,000,000 tons of rails were made and by the Siemens 40,000 tons. Sir Frederick Bramwell, who was president in 1874-75, in his address at the Cardiff meeting strongly directed attention to what he correctly termed the cruelly and wickedly wasteful manner they were rapidly using up the principal source of the wealth and power of the country, namely, coal. At that time 120,000,000 of tons were being raised in the United Kingdom, and to-day nearly 200,000,000. These grave words of warning did not receive the attention they deserved, and he could repeat them to-day with even greater emphasis; but he (the president) feared no words of warning, however clearly and solemnly they might ring out by even this great and observant authority, would avail with those who worked collieries "with no other object than that of obtaining the utmost profit out of them." At the summer meeting held in Bristol in 1877, the president (Mr. Thomas Hawksley) in his address took a gloomy view of the relations existing between employers and employed, asserting that our labour was too dear for successful competition with foreign countries—too dear in respect of the quantity of work performed, and too dear in respect of the obstructions and restrictions which the modern workman thought fit to place upon his employment and employer. After a lapse of twenty years these words seemed even more applicable to the present state of those relations than they were at the time they were written. To complete the list of the half-century of presidents, it was necessary that he should add the name of Edward Windsor Richards, 1896-97. All that need be said of him was that he greatly desired to be of service and further the interests of the Institution. He had the earnest hope and belief that when the centenary was

celebrated the then president would be able to congratulate the members on the progress made in the second half of the century, and that it would be as great as or greater than that of the first half, and that the home built at this time for the purpose of drawing the members into closer companionship might have greatly contributed to that increased success. The Institution house was now making rapid progress, and the architect held out the hope that the lecture theatre would be available for the next spring meeting. The review of the work of the Institution was sufficient to prove that they had carried out the objects for which the Institution was formed, and they could justly claim that they had contributed largely to the general happiness and material prosperity, not only of the people of Great Britain, but of the whole civilised world. Although they had reached their jubilee year, they were still in their youth, full of vigour and full of determination to keep abreast with all progress affecting their profession.

THE POST OFFICE SITES BILL.

THIS Bill, as amended by the select committee, has just been issued. As originally introduced by Mr. Hanbury and Mr. Akers-Douglas the Bill proposed that certain disused burial-grounds attached to the parishes of Christ Church, Newgate Street, St. Botolph Without, Aldersgate, and St. Leonard, Foster Lane, generally known as the Postmen's Park, should be maintained as a public garden, and that for that purpose the Postmaster-General should pay to the London Parochial Trustees the sum of 100 $\frac{1}{2}$ per annum and the said trustees should pay to the vicar and churchwardens the sum of 200 $\frac{1}{2}$ per annum so long as the public garden was maintained in good order. The London Parochial Trustees have power to build upon or lease for building purposes a plot of land lying between the garden and Little Britain, and as the garden was largely used by the *employés* of the Post Office and would be seriously injured if the Little Britain land should be built upon, the vicar and churchwardens, in consideration of the same being maintained as an open space and part of the said public garden, agreed to assign to the Postmaster-General the 200 $\frac{1}{2}$ per annum payable to them by the London Parochial Trustees. This portion of the Bill was struck out by the select committee, and the Bill now simply provides for the acquisition of lands by the Post Office in London, Brighton, Norwich, Plymouth, Southampton,

Oban and Cork. There is a special proviso, for the protection of the London and South-Western Railway Company, that in case the Postmaster-General should at any time abandon a part of the land at Southampton he should offer it to the South-Western Company.

THE MARCHIONESS OF LORNE AS AN ARCHITECT.

THE Princess Louise, Marchioness of Lorne, is familiar to the public as an amateur painter, and as one who can handle the sculptor's chisel. Her Royal Highness, says the *St. James's Gazette*, has now turned her attention to the more practical art of architecture, and workmen are at present engaged in completing a building designed by the Marchioness (with the assistance of a young London architect) and erected on the Argyll ducal estate in Scotland. The plans designed by her Royal Highness were for the extension of the little hostelry at Roseneath, a sylvan shaded resort most charmingly situated on the western bank of one of the long blue lochs that open off the Firth of Clyde. Roseneath is one of the quietest retreats on the Clyde. Few trippers profane its walks, and house-letting accommodation is limited in the extreme. On this account the Marchioness and the Marquess of Lorne have for some years past found in Roseneath a delightfully quiet recruiting-ground at the close of the London season, and the little inn has been their home. The enlargement designed by the Marchioness is being carried out to provide a wing for the distinguished couple when they visit the district. The wing will include some half a dozen bedrooms, public rooms, a spacious hall and offices, and the plans have been drawn up with an architectural success so great that the work may in coming years be looked back upon as the pioneer design in the opening up of a new field for the ever-widening work of womankind. The drawing-room is a handsome apartment, and its large windows face the picturesque waters of the Gareloch and Ben Lomond, while a spy window has been inserted, no doubt for the purpose of commanding a pretty peep of the western sunsets and the Argyll hills. There is also an alcoved fireplace with arched stone mantelpiece. In the dining-room the windows have Mediaeval arches and iron mullions, with casements and small panes. A gun-room is also provided, and, as becometh a lady architect, the kitchen is a culinary poem in red-tiles. Internally

perfect in design, externally the building is straggling and far from pretty. It has many quaint features, however, in the form of knobbed rhones, spouts instead of rain-conductors, and basket windows. The design is royal and also unique, and the inn when finished will be by no means a conventional one. So close is the interest taken in the work connected with the rearranged hostelry by Her Royal Highness that she intends herself to paint the device on the sign that is to hang in old-time fashion over the doorway of the public entrance to the building, and the walls of the new apartments are to be artistically decorated according to the Marchioness's own scheme of treatment.

ROCK-CUT TOMBS, TEMPLES AND HABITATIONS.*

DURING the early period of Egyptian civilisation, its monarchs erected for themselves immense tombs, partially excavated in the rock, covering large areas and terminating in a point—in short, the everlasting pyramids. During the next or Theban period their attention was directed to the construction of immense temples, the walls and passages of which were covered with exquisite sculpture illustrating the exploits of the kings, their names, genealogical records, as well as many of the incidents of their everyday life, by which the students of this interesting subject have been enabled to present us with a definite idea of the laws and customs of this wonderful people. A little distance from the city of ancient Thebes, and hidden from the city by a range of the Libyan hills, is a valley now designated as the "Valley of the tombs of the kings." This valley is a bare, rugged ravine scooped in the rock by an extinct torrent, the baked cliffs reflecting the noonday sun till the gorge resembles a heated oven. The tombs in this one valley number twenty-five (there are, hundreds in other parts of the mountain), and from Amenoph III. to the end of the twentieth dynasty, not a single royal tomb but that of Horus is missing. Both in Egypt and in Nubia the Egyptians were in the habit of excavating monuments from the living rock, but with this curious distinction, that, with scarcely an exception, all the excavations in Egypt proper are tombs, and no important example of a rock-cut temple has yet been discovered. In Nubia, on the other hand, all the excavations are temples, and no tombs of importance are to be found any-

* A paper by Mr. Cyrus K. Porter, published in *Stone*.

SOHO COWL AND VENTILATOR (NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."
"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."
"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

where. This distinction may hereafter lead to important historical deductions, inasmuch as on the western side of India there are an infinite number of rock-cut temples, but no tombs of any sort.

Every circumstance seems to point out the fact that if there were any connection between Africa and India it was with the provinces in the upper part of the valley of the Nile and not with Egypt proper. This, however, is a subject that can hardly be considered here, though it may be useful to bear in mind the analogy here alluded to.

A recent traveller thus describes the "Valley of the tombs of the kings," to which I have referred:—"The valley is a singularly impressive site for a burial ground. Steep cliffs shut it in on every side; not a blade of grass nor a living thing can be seen; nothing but burning rock on the right hand or on the left. Here and there a steep slope leads down to a gloomy cavern's mouth. We enter a long tunnel-like passage, lofty and wide, but growing more intensely dark at every step. Candles show us that the walls are covered with pictures, and as we enter the larger chamber, or chambers, to which the passage leads, the eye becomes accustomed to the partial light, and the design of the artist becomes clear. It is the progress of the soul through the under world that we are witnessing in these pictures which line the dimly-lighted walls."

The following description from Mariette's "Monuments of Upper Egypt" may throw some light on the symbolic significance of the pictures above alluded to. This noted Egyptologist says:—

"Immediately on entering the tomb the visitor finds himself transported to a new world. The almost joyous pictures of Sakkarah and Beni Hassan have altogether disappeared. The defunct is no more to be seen at home in the midst of his family. No more making of furniture, no more building of ships, no more extensive farmyards with cattle, oxen, antelopes, wild goats, geese, ducks, demoiselle cranes marching in procession before the stewards. All has become, so to speak, fantastical and chimerical. Even the gods themselves assume strange forms. Long serpents glide hither and thither around the rooms or stand erect in the doorways. Some convicted malefactors are being decapitated and others are precipitated into the flames. Well might a visitor feel a kind of horror creeping over him if he did not realise that after all underneath all these strange representations lies the most consoling of all dogmas, that which vouchsafes eternal happiness after the many trials of this life. It has been said before that according

to their kings the honour of burial, the Egyptians passed judgment upon them. This legend must, of course, be understood in an allegorical sense. The judgment of the soul after being separated from the body and the many trials which it will be called upon to overcome by the aid of such virtues as it has evinced while on earth, constitute the subject matter of the almost endless representations which cover the walls of the tomb from the entrance to the extreme end of the last chamber. The serpents standing erect over each portal darting out venom are the guardians of the gates of heaven; the soul cannot pass unless justified by works of piety and benevolence. The long texts displayed over other parts of the walls are magnificent hymns to which the soul gives utterance in honour of the divinity whose glory and greatness he celebrates. When once the dead has been adjudged worthy of life eternal these ordeals are at an end; he becomes a part of the divine essence and henceforth a pure spirit; he wanders over the vast region where the stars for ever shine. The soul has no sooner left the body than we are called upon from room to room to witness its progress as it appears before the gods and becomes gradually purified, until at last in the grand hall at the end of the tomb we are present at its final admission to that life which a second death can never reach."

Of the first ten dynasties of Egyptian kings little now remains but their tombs, the monumental pyramids, and of the people they governed, only the structures and rock-cut excavations which they prepared for their final resting places.

Theban kings and their subjects erected no pyramids, and none of their tombs are structural, all are excavated from the living rock, and from Beni Hassan to the cataract, the plain of the Nile is everywhere fringed with these singular monuments, which, if taken in the aggregate, perhaps required a greater amount of labour to excavate and adorn than did even all the edifices of the plain. Certain it is that there is far more to be learned of the arts, of the habits and of the history of Egypt from these tombs than from all the other monuments. It appears to have been a custom with these kings, so soon as they ascended the throne, to begin preparing their final resting place. The excavation seems to have gone on uninterruptedly year after year, the painting and adornment being finished as the work progressed, till the hand of death arrested the king's reign and simultaneously the works of his tomb. All was then left unfinished, the cartoon of the painter and the rough work of the mason and plasterer were broken off, as if the hour of the king's demise called them too irrevocably from their labour.

Stone and Wood Work. 37 King Street, Derby

The tomb thus becomes an index of the length of the king's reign as well as his magnificence. Of those in the valley of the kings the most splendid (says Fergusson) is the one opened by Belzoni, and now known as that of Menephthah, the builder of the hypostyle hall at Karnac. It descends in a sloping direction for about 350 feet into the mountain, the upper half of it being tolerably regular in plan and direction, but after progressing as far as the unfinished hall with two columns the direction changes, and the works begin again on a lower level, probably because they came in contact with some other tomb, or in consequence of some flaw in the rock. It now terminates in a large and splendid chamber with a covered roof, in which stood, when opened by Belzoni, the rifled sarcophagus; but a drift-way had been excavated beyond this as if it had been intended to carry the tomb still further had the king continued to reign.

The tomb of Rameses, the first king of the nineteenth dynasty, is more regular and in some respects as magnificent as the one just described. That of Amenoph is also an excavation of great beauty, and is adorned with paintings of the very best age of Egyptian art. All the tombs depend for their magnificence more on the paintings that cover the walls than on anything that can strictly be called architectural. Generally speaking, it is assumed that the entrances of these tombs were meant to be concealed and hidden from the knowledge of the people after the king's death.

It is hardly conceivable, however, that so much pains should have been taken and so much money expended on what was designed never again to testify to the magnificence of its founder.

The Egyptians were not likely to attempt a thing so nearly impossible, for though the entrance of a pyramid might be so built up as to be difficult of discovery, a cutting in the rock could never be repaired or disguised, and could only be temporarily concealed by heaping rubbish over it. Such an expedient, if resorted to, has proved futile, for all the royal tombs in the valley have been opened and rifled in a past age, and their sites and numbers were matter of public notoriety in the time of the Greeks and Romans. Many of the private tombs have architectural façades, and certainly were never meant to be concealed, so it is not fair to assume that hiding their tombs' entrances was even a peculiarity among the Thebans, though it certainly was of the early Memphite kings.

If we were to enter upon a minute description of the many beautiful and interesting objects which the research of students and archaeologists have brought to light, in reference to the rock-cut tombs of the Pharaohs, we would exhaust your patience and greatly exceed the limit allowed us. We will therefore turn our attention to the consideration of similar works which have been found in other countries. Leaving the "Valley of the tombs of the kings of Egypt" to bask in the lurid glare of an almost tropical sun, we will turn our attention to the country of another ancient people whose early history is intimately interwoven with that of ancient Egypt. I refer to the land of Judea, commonly called the "Holy Land."

It is quite likely that the children of Israel after a residence in Egypt of several generations acquired many of the habits and customs of the Egyptians; particularly may this have been the case so far as their architecture was concerned. There is no evidence that the Israelites of themselves were skilled in architecture or building; in fact the first important building erected by them, Solomon's temple, was executed by skilled workmen sent by Hiram, king of Tyre, to the assistance of his personal friend, Solomon, king of Israel.

Among the remains of ancient architecture which have been discovered recently in the neighbourhood of Jerusalem are a number of sepulchral chambers hewn out of solid rock. They are called the tombs of the kings of Judah. They vary in size from 10 to 20 feet square, and contain sarcophagi. They are entered exactly like the tombs of Beni Hassan, by a portico *in antis* about 40 feet wide. There are two columns and two pilasters in front of Greek Doric character, about 13 feet high. The most curious feature is that a broad band about 3 feet wide, richly sculptured, with foliages, runs down each side 4 or 5 feet and over the columns horizontally. Above this band, quite independent of the lower construction, is a regular Doric architrave and frieze of a character between Grecian and Roman. This is ornamented with triglyphs, rosettes and foliage. In front of the portico is a courtyard about 100 feet square.

In the valley of Jehosaphat, near Jerusalem, are three extremely curious relics; two stand alone on platforms excavated from the rock, and the third is scarfed into the rock itself. The first is called the tomb of Absalom. It is a square building with a solid wall, in which are engaged Ionic columns about 13 feet high. Over this is a Doric entablature with triglyphs and an altar surmounted by a very curious sort of hollow-sided cupola of trumpet-mouthed section and a terminal. The whole, including the flight of steps, is about 60 feet high. Another similar building of about the same size is commonly called the tomb of the prophet Zechariah. This is surmounted by a simple pyramidal roof. Beneath it is

a handsome doorway leading to a sepulchral chamber. Over the ordinary classic entablature is the regular Egyptian cornice, or torus, surmounted by a bold quarter hollow and fillet exactly like those on the propylons of Egypt. The third building is entirely rock-cut and consists of a large façade about 90 feet wide and 100 feet high. This is reported to be the place to which the Apostles retired before the siege of Jerusalem. Below is a plain face about 45 feet high, on each side of which are wings with two pilasters both running up to the top of the building. Between these is a portico about 40 feet wide with columns and pilasters of nearly pure Grecian Doric.

These buildings could not lay claim to any great antiquity; from their architecture they are probably of the time of Herod, while the Egyptian cornices show that the traditional ornaments of that people had not been entirely forgotten.

(To be continued.)

SANDERSON'S UNIVERSAL SWING-FRONT CAMERA.

It is not a little surprising that the photographic camera, after an existence of very nearly sixty years, still leaves considerable scope for improvement as an instrument of precision. Of those who practise photography, few have so much reason for realising its deficiencies as those whose concern lies in the production of views of architectural subjects. For this class of work it is easy to understand what the theoretically perfect camera should be able to do. Starting from the necessary fact that the focal plane must be maintained in strict parallelism with the anterior end of the camera, it is essential that such control be had over that part of the instrument which carries the objective that it should be within the power of the operator to direct the axis of the lens to any part of the focal plane or sensitive surface at will.

Very little reflection will apprise our readers that the ordinary camera of the usual construction only complies with this demand or theory in a perfunctory fashion. In the first place, nearly every camera is so constructed that the maximum amount of elevation or depression which it is possible to give to the lens front falls far short of what is frequently required in cases where, for example, it is imperative at close quarters to cut off the foreground and include as much of the top part of the subject as may be desired. In extremities of this kind it is frequently compulsory to tilt the camera upwards, which necessitates that the back of the camera, that carries the focal plane, should be swung so that the distortion of the image which would otherwise be produced is corrected. It will be manifest that this system not only debars the photographer from including the maximum amount of subject on the plate, but, in virtue of the fact that he is restricted in the extent to which the lens may be moved up or down, it is frequently found that the full covering power of the objective cannot be availed of.

Sanderson's Universal swing-front camera completely remedies these deficiencies of the ordinary type of camera. The principle involved in its construction throws the whole of the work to be done upon that part of the camera which is obviously the point from which the movements of the lens should be made, viz. the front. The back of the camera is not required to swing, and thus it is always fixed at right angles to the baseboard. It necessarily follows from this that, the screen or focal plane being always vertical, an efficient method of raising, lowering and tilting the lens is all that is required to make the camera both theoretically and practically perfect.

This end is attained in a manner at once simple and ingenious. The front of the Sanderson camera is fitted with a movable panel carrying the lens, which is immediately screwed on to a revolving disc. The motion of the front is controlled by milled head screws running in pivoted slotted arms affixed to the baseboard, and thus the lens may be lifted or depressed to the utmost extent, while clearly it may also be extended in a forward direction, so as to admit of lesser or varying focal

lengths being employed. Moreover, the same movement of the milled head screws in the slotted brass struts allows of the lens being swung to any extent, so that, whatever its position in relation to the focal plane, may be the full covering power of the objective is utilised. The operator can effect all these adjustments with his head under the focussing cloth, the disengaged hands operating the front of the camera.

To architectural photographers especially the Sanderson camera should be welcome, as it solves a difficulty that has always existed in practical photography. It is surprising that it should have been left so late ere an attempt was made to improve the photographic camera in the direction in which it has long urgently called for improvement.

We may mention that the Sanderson camera was recently subjected to a very severe practical test in the presence of some of the foremost photographic experts of the day. A difficult architectural subject at close quarters was chosen at Cambridge for the purposes of the test, and with the best types of ordinary cameras in skilful hands pitted against it, the Sanderson camera demonstrated that its universality of swing front movement was not only needed for the inclusion of the maximum amount of the subject in the plate, but the image was absolutely undistorted, and the full covering power of the lens was utilised. In these crucial respects: the other cameras failed to do the work with anything like the completeness of the Sanderson—excessive amounts of foreground, distortion of the perpendiculars and inability to utilise the full covering power of the lenses used characterising the results. It amounts to this, that for practical purposes the Sanderson camera possesses every possible movement, and thus where it is most needed, viz. in architectural work, a branch of photography which by its nature presents the greatest difficulties to the photographer, it easily demonstrates its superiority over other and older forms of cameras.

The sole licensees and manufacturers of the Sanderson camera are Messrs. George Houghton & Son, 89 High Holborn, W.C.

"EXTRAORDINARY TRAFFIC" ON ROADS.

THE case of the Kent County Council against Lord Gerard will no doubt rank as one of the most tantalising lawsuits of recent times. If British law oscillated so strangely as a general rule, the British law-makers might be painfully surprised one morning to find themselves being hurried out of their homes and strung up one by one as reparation to an outraged public. Happily, cases like the present are exceedingly rare. Lord Gerard has a mansion at Eastwell Park. He began to rebuild it. For this purpose large quantities of building and other materials were hauled over the public roads by traction engines. The roads were cut up all the length of the way. Hundreds of pounds of damage must have been done. The County Council sued Lord Gerard for compensation. Lord Gerard held that the contractors were liable. The magistrates gave a decision against Lord Gerard, the Quarter Sessions reversed the decision of the magistrates, then the Queen's Bench reversed the Quarter Sessions, then the Court of Appeal reversed the Queen's Bench, then the House of Lords, after much painful excogitation, decided to uphold the Court of Appeal.

STEEP GRADE RAILWAY AT BRIGHTON DYKE.

A RAILWAY or tramway running up and down the precipitous face of the Devil's Dyke near Brighton was opened on Saturday. There are already established at the highest point of the dyke an aerial railway running from hill-top to hill-top, and a number of other contrivances, in which the excursionist appears to take delight, for securing locomotion under novel conditions. The steep-grade railway, however, claims some amount of utility in affording rapid communication between the Brighton Railway Company's branch terminus at the head of the dyke, and the villages lying in the plain at the foot of the dyke hills. It is of the same type as the cliff railways at Scarborough and elsewhere, although the engineer, Mr. C. O. Blaber, has introduced some new features in the details of construction. The whole length of the line is 840 feet, the "lift" being 395 feet. From the top there is a run of 240 feet at a gradient of 1 in 1.8, the second and steepest part being 1 in 1.5 and the last and lowest gradient 1 in 2.9. The vertical curves between the different gradients have about 1,000 feet radius. There being a scarcity of water as well as of solid fuel at the head of the Dyke, the hauling power is obtained from a Hornsby-Ackroyd oil-engine. The haulage ropes are two 2-inch steel wire cables, and the cars, each seating 14 persons, are fitted with powerful brakes by which a car running down hill would be promptly stopped before any great momentum had been obtained. The brakes are also designed to prevent the cars from leaving the track. There is a powerful brake on the shaft of the main hauling pulley, worked by a foot lever, as well as from the platform. Spring buffers are provided at the lower end of the line, but there is an obvious need

of buffers also at the top. The opening ceremony was performed by Sir H. Howorth, M.P., who turned the lever which set the cars going. There were also present during the day General and Mrs. Penny, the Hon. F. Byng, Mr. F. A. Darlington, secretary of the company, and a large number of visitors.

EXTRAS ON CONTRACTS.

THERE is nothing which seems to give more annoyance to the average engineer or the architect, says the *Engineering Record*, than the inevitable "extras" on contracts. We cannot but feel, however, that this is to a large extent unnecessary, for if the matter is properly considered the much-abhorred "extra" will be found to lose most of its terrors. We have heard a prominent mechanical engineer boast of having put in a large and conspicuous steam plant on which the total bills of extras "did not exceed 1½ per cent." It was added, however, that the specifications on the piping alone covered forty-eight typewritten pages. In this lay the secret of the small percentage, but it is doubtful if it was not accomplished at considerable expense to the plant.

It is of course commendable to have as much as possible of the entire work included in the original specifications and contracts, but in their desire to obtain this result engineers are accustomed to fill their specifications with all sorts of general clauses and indefinite requirements which are intended to cover "all possible contingencies" which may arise, and also to throw the final responsibility for the satisfactory working of the plant upon the contractor. It appears to us that this is a mistaken principle. An engineer who is entrusted with the design and superintendence of work should not hesitate to take some of the responsibility for its success upon himself; and it is much better—more to the interest of economical construction—to make all specifications concise, definite and explicit on every point which they are intended to include than to permit any general or indefinite clauses. In every work there are almost invariably some parts which can be let to much better advantage after the remainder is wholly or nearly completed, even if at such times they have to be let as extras. For instance, in steam-plant construction the piping between the boilers and engines cannot be laid out or satisfactorily contracted for before the machinery itself is decided upon, and the pipe covering cannot be let to advantage before the piping is all arranged. It is, moreover, often, if not generally, the case that a portion of such work can be laid out definitely and a contract let for it at the outset. The remainder, which cannot be definitely arranged until certain contingent details are decided upon, can in reality be dealt with to much better advantage as an extra.

The general clauses which are put into specifications to cover contingencies are the source of misunderstandings and disputes between the engineer and his contractor, and they engender that spirit of antagonism between them which necessarily results harmfully to the work in hand. A contractor in making his estimates must of necessity "figure himself safe" on all parts which are not definitely and distinctly specified, and allow a conservative margin for quantities of material and labour on those which are not properly laid out and shown on the plans. In putting up such work any chance for disagreement tends to result in cheapening its character.

In preparing his plans and specifications and in letting the first contracts the engineer or architect should know from his own study of the work where "extras" will be encountered, and he should make careful statements and estimates of them for the benefit of his clients. Such parts of the work can then wait till near the time of completion and be let as extras, when full information is available based on locations and measurements of the work actually installed. The engineer should in all cases be sufficiently familiar with the current prices of material and labour, and the amount of the latter required, as to know himself the fair price for the extras when he comes to let them. When work is let on plans and specifications which are concise and definite in detail, contractors can invariably give much closer and more accurate figures. The treatment of extras in a fair-minded and equitable spirit invariably tends towards a high standard of workmanship, and results in the greatest economy to the work itself.

THE NEW DOCKS AT BUENOS AYRES.

THE port works of Buenos Ayres, recently opened, have cost the Argentine National Government 7,000,000*l.* in gold. They have been constructed by English contractors and engineers, and are the largest, newest and the best-equipped docks on the American continent.

These works were authorised in 1882 during the presidency of General Roca. Preliminary plans were prepared by Sir John Hawkshaw's firm, and in 1884 a concession for the works

was granted to the late Mr. Madero, whose name is closely identified with the docks. The work chiefly consisted in the conversion of the flat, muddy banks of the River Plate for a distance of three miles in front of the city of Buenos Ayres into a succession of basins, locks and docks, the whole of the works being enclosed in long, massive stone walls, reclaiming a vast area of valuable building land. The docks are approached by means of two newly-dredged channels, one to the south basin, the other to the north basin, these two channels converging in the River Plate some six or seven miles from the city.

Upon the advice of the late Sir John Hawkshaw these important works were entrusted to the late Mr. Thomas A. Walker, who was then just completing the Severn Tunnel. Mr. Walker entered into a contract to construct the works in 1885, and after the preparation of the various detailed plans the works were started in the spring of 1887.

The works were so designed that each basin or dock could be opened, and thus earn money, as finished. The South Basin, covering 35 acres of water space, was opened in January 1889, Dock No. 1 in January 1890, Dock No. 2 in September 1890, the third dock in 1893, the fourth in 1896, and the North Basin last March.

The docks and their equipment as originally designed were intended to cost 4,000,000*l*. There have, however, been very great additions to the original scheme. Numerous warehouses of enormous dimensions, all of which are crowded with goods and produce, have been erected; two graving docks, now the largest in South America, have been built, for preparing warships and ordinary steamships; the hydraulic machinery has been increased and many miles of additional railways laid. The result is that the works have cost upwards of 7,000,000*l*.; but this cost compares very favourably with the cost per acre of the docks at Liverpool, London and Antwerp.

Apart from the important impetus which the improved shipping and warehouse facilities have given to the general trade of the Argentine Republic, the docks, crowded as they already are, show at present a net return of nearly 4 per cent. upon the outlay.

Unfortunately, neither the Argentine concessionaire, Mr. Madero, nor the English contractor, Mr. Walker, lived to see the completion and the financial success of their work. Mr. Walker died in November 1889, being then engaged in constructing not only the Buenos Ayres harbour works, but the Manchester Ship Canal, the Barry docks and railways, the Preston docks, besides other undertakings—a herculean work

for one man. Since that date the various works have been carried out by Mr. Walker's executors, special powers being obtained from Parliament for this purpose; but the Buenos Ayres works have been in charge of Mr. Charles Walker, the late Mr. Walker's nephew, who has resided at Buenos Ayres, to whom, as also to Mr. Dobson, the resident engineer, and Messrs. Hawkshaw & Hayter's partner, the main share of the credit, so far as the construction is concerned, is due.

The whole of the hydraulic machinery for the docks was supplied by Sir W. Armstrong, Mitchell & Co., of Newcastle.

THE UGANDA RAILWAY.

A REPORT on the progress of the Mombasa-Victoria (Uganda) Railway during 1896-97 states that the work began on December 11, 1895, and was somewhat impeded during the early months of 1896 by the disturbed state of the country, and by the consequent inability of the Protectorate to furnish efficient guards. The general arrangement decided on at the start was somewhat as follows:—

1. The preparation of the base.
2. An advance survey division to examine the country and stake out the railway for construction.
3. Mountain survey divisions, which have been sent forward to thoroughly investigate the difficult country at Kibwezi, in Kikuyu, and onwards towards Lake Victoria.
4. A surfacing division to prepare the ground for a surface line.
5. A plate-laying division to lay the rails and get the road in order, fit for the passage of material trains on a surface line.
6. The permanent works divisions to carry out the permanent earthworks and structures necessary for the completed railway.

On landing the staff found no accommodation of any sort available either for themselves, for labourers, or for stores. The first need was to run up huts which would give shelter. The next was to provide some kind of dépôt for the expected stores. The third was to make provision for unloading steamers, the first of which was expected to arrive in May 1896. Three lighters were bought from the Protectorate officials, and a temporary jetty was constructed on the Kilindini Harbour side of the island. The stores left by the Imperial British East Africa Company were inspected and taken over, but these

READING CASES FOR THE ARCHITECT

Price Two Shillings.

OFFICE: 175 STRAND, LONDON, W.C.

proved of very small value for a railway project, being mostly odds and ends such as accumulate at any central store, chiefly because there is no demand for them, and it was not until the first shipload of stores was received that much real progress could be made. Before a mile of the railway could be laid it was necessary to perfect the arrangements at the base. The open level space on the island, and its proximity to the excellent harbour of Kilindini, pointed it out as the best position for the storeyard, repairing shops and terminus of the railway. These great advantages and the broken nature of the ground on the mainland determined the chief engineer to make the island his base, and 372 acres of land were acquired here, mostly from private owners. On this open space has been laid out a station, with room to stack the permanent-way material and bridgework for the 700 miles of line. Temporary offices and quarters for the superior and subordinate staff have been erected, made of timber or galvanised iron, and raised off the ground for sanitary reasons. The first works undertaken, besides the construction of a jetty for landing stores and sheds for sheltering perishable stores when landed, were the connection of the island with the mainland by a timber viaduct. The water supply was a source of the gravest anxiety. It became imperative to procure and erect condensing machinery in case of the failure of reservoirs and springs, and plant capable of producing 12,000 gallons of fresh water per day was erected. Houses, hospitals and erecting shops for rolling-stock, workshops, &c., were the next necessities, and these have been completed or are far advanced.

Up to the thirty-fifth mile the roughness of the ground has precluded the laying of the surface-line contemplated. The permanent formation has had to be prepared in the usual manner, and the progress of the rails has had to wait on earth-works in alternate cuttings and embankments ranging up to 45 feet in depth and height; hence the progress of the work on this section has been slower than would have been the case had it been possible to adhere to the general plan of operations. Two engines and twenty-five waggons were procured from the Indian metre-gauge railways for an early start; four more engines and 100 waggons have recently come from the same source; while eight engines, about 100 waggons, ten third-class carriages and twelve brake-vans have been delivered from England for use in construction. More are under supply. During the months of November and December, 1896, and January and February, 1897, the health of the staff and of the labourers was very bad. The effect of turning up of the soil,

which in tropical countries almost invariably results in great increase of malaria, has in the present case been aggravated by unusual and unseasonably heavy rains, which continued through November and December, 1896, and January, 1897. Ulcers have been very prevalent among the Indian coolies, and over 50 per cent. of them have been down with malarious fever. The whole European staff has from time to time suffered severely from the latter. The total expenditure up to March 31, 1897, was 390,838*l.* Of this amount 211,580*l.* represents the cost of material from England, including freight, and the remainder expenditure in India and Africa.

PATENTS.

This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 16416. Hugo Beien, for "Improvement in door-latches."
- 16461. Hubert Edward Seaward Edmond, for "An improved window-frame and sash for cleaning, ventilating and general purposes."
- 16464. James Bazeley Potter, for "Improvements in grates or stoves."
- 16506. Joseph Smith, Henry Smith and Samuel Skerrett, for "An improved drop-down bar and coal-saver for fireplaces."
- 16596. Casel Heinrich Andres Cordes, for "An improved method of attaching sash-lines to window-frames."
- 16674. Mark Gentry and Hartley Grunwell, for "Improvements in machinery for pressing bricks."
- 16675. Thomas Callow and Lewis Peter Ford, for "Improvements in materials for firebricks, gannister and the like."
- 16498. Arthur William Latham, for "A new or improved window-sash fastener."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. Ploughing.

2. Harrowing.

3. Mowing.

4. Carting.

5. The Products of the Corn Field.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A **SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY M. PAUL ALBERT BAUDOIN.**

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

DO YOU KNOW THE ADVANTAGES OF SANDERSON'S PATENT CAMERA? FOR ARCHITECTURAL PURPOSES.

IF NOT, READ THE
You will then learn of what im-
It saves time,

SUCCESS. Without Trouble.

TOWER & GATEWAY, CHRIST COLLEGE, CAMBRIDGE.

Taken under Test conditions. A difficult subject, owing to its height and narrowness of the street.

Fig. 2 was taken with SANDERSON'S PATENT CAMERA, the Tripod remaining perfectly level, there being no necessity to tilt it, as is usual with other cameras. No difficulty was experienced in properly composing the subject owing to the great range of the Patent Rising and Swing Front, which reduces the adjustments to a minimum, and does away with the necessity of the orthodox Swing Back.

To accomplish the above it was necessary to raise the lens (a 6 in. Zeiss on a 10 x 5 plate) above its covering power, but by bringing SANDERSON'S PATENT SWING FRONT into play, which enables the axis of the lens to be directed to the bottom of the plate, perfect covering power and illumination was immediately obtained, as in Fig. 2.

Fig. 3 represents the best possible result that could be obtained with the same lens on a first-class modern Camera, furnished with the usual Swing Back, Rising and Swing Front, &c., these movements having been strained to their utmost limits, and the Tripod tilted to a dangerous degree.

FOLLOWING TEST.
mense value one would be to you.
temper, and plates.

FAILURE. With all the old Troubles.

Fig. 3.

Fig. 3.—Taken with ordinary camera after straining movements to the utmost.

The above results point to the perfection of SANDERSON'S PATENT CAMERA for work of this description more forcibly than any arguments for or against its principles.

A Descriptive Pamphlet may be obtained on application to the Sole Licensees and Manufacturers—

BUILDING AND BUILDERS.

THE old building known as the Fine Art Gallery, Old Christchurch Road, Bournemouth, is in course of demolition to make room for shop property.

A PROPOSAL is on foot to restore West Stafford parish church, near Dorchester, as a memorial to the late Canon Reginald Smith, for more than half a century rector.

UNDER the auspices of the Bar Congregational church at Scarborough a new church, to seat 500 persons, is about to be erected in the north-west ward.

FOR the congregation which for over two years has met in the Co-operative Hall at Ossett a new Congregational church and school are about to be erected.

ON July 31 the corner-stones of a new Liberal club, which is being erected at Norden, in the Heywood parliamentary division, were laid by Alderman William Healey, mayor of Heywood.

AT four o'clock to-morrow afternoon the Duke of Connaught will lay the foundation-stone of a new hospital at Southsea, the funds for which have been raised to commemorate the sixty years' reign.

THE foundation-stone of an isolation hospital which is in course of erection at Isleworth has been laid by the Duchess of Teck. The site of the hospital is in a remote part of Isleworth parish, not far from the Kneller Hall School of Music. Provision is made for forty-six beds.

THE Countess of Warwick opened her secondary and technical school at Dunmow on July 30. The school, which is a new building near the ancient mansion of the Fitzgeralds, is fitted up for the accommodation of 100 pupils, and in connection therewith are schools for laundry and needlework.

THE Highgate Police Court, which has hitherto been held at Northfield Hall, having been found inconvenient, a site has been purchased in the Archway Road on which will be erected a new court, and an adjacent site is to be covered by a police station. The foundation-stone was laid on the afternoon of the 3rd inst. by Mr. R. A. M. Littler, C.B., Q.C., chairman of the Middlesex County Council and Quarter Sessions.

THE estate of West Bangour, near Uphall, has been purchased on behalf of the Edinburgh Lunacy Board at the price of 13,000/. The extent of the property is about 861 acres, of which 86 are woodland. The gross rental is 639/., and the public burdens average about 132/.. The property has been

445 OXFORD STREET, LONDON, W.

purchased for the purpose of erecting upon it a new asylum for pauper lunatics in consequence of the necessity imposed upon the Board of removing the pauper lunatics from Morningside Asylum.

THE memorial-stones of a Wesleyan school-chapel were laid on July 31 on a vacant piece of ground in Ladypit Lane, Beeston Hill, Leeds. Mr. G. F. Danby is the architect for the new structure, which will be of brick with stone dressings, plain externally but commodious, affording accommodation for 250 worshippers. There will also be three classrooms, and by means of a patent folding partition one of these will, when occasion demands, supply fifty additional seats. The total cost is estimated at 1,250*l*. Mr. W. Schofield has the contract for the brick and stonework, and Messrs. J. Tomlinson & Son that for the woodwork, a large portion of which will be pitch pine.

THE new Verdin Technical Schools and Gymnasium which have been erected at Northwich, from the designs of Mr. J. Cawley, architect, of Northwich, by Mr. W. Molyneux, of the same place, were recently opened by the Duchess of Westminster. The site, which contains 2,619 yards, is situated in the London Road, to which it has a frontage of 132 yards. The building, which is of two storeys, is in Renaissance style, with terra-cotta enrichments, and within it provision is made, on the most approved scale, for technical and manual instruction, art teaching, &c. There are a chemical and a physical laboratory, a spacious art school, classrooms, workshops, cookery-room and laundry, with all the necessary adjuncts thereto. The gymnasium is placed on the south side, and is 60 feet long by 31 feet 6 inches wide, and of great height, a gallery being placed at one end. The apparatus provided in all the departments is the best of its kind. A striking feature in the building is the stained-glass of the windows. The "Empire window" over the main entrance, and the "Victorian window" over the entrance to the art department, are excellent specimens of stained-glass. The inclusive cost of the buildings is 12,000*l*.

A GRANITE obelisk, which has been provided by public subscription as a permanent memorial of the seventy years' labour of the veteran Primitive Methodist, the late Mr. Thomas Bateman, was unveiled in Chorley burial-ground, Nantwich, on Wednesday last.

ELECTRIC NOTES.

THE Bo'ness Harbour Commissioners have authorised their engineers, Messrs. Thomas Meek & Son, to prepare a specification and obtain tenders from several firms of electrical engineers for lighting the harbour and docks with an installation of the electric light.

A COMPANY has offered to take over the provisional order for electric lighting when obtained by the Dorking Council, and to establish works for the public and private supply of electricity on certain terms. Mr. Warden-Stevens, of Westminster, has been retained by the Council to advise them in the matter.

THROUGH some failure of the machinery at the Edinburgh Corporation Electric Lighting Station, a large portion of the city of Edinburgh was about midnight on August 1 plunged in total darkness. All the street lamps went out, and the gas lamps having been entirely removed from those thoroughfares where the electric light has been substituted, those privileged streets had to remain destitute of artificial illumination. No explanation was offered of the cause of the failure, which was most seriously felt in the newspaper offices and other establishments where night work is a necessity.

VARIETIES.

THE water supply of towns is being largely attended to in New South Wales. Twenty-four municipalities in the colony own waterworks constructed at a cost of 546,088*l*., and others are being established, at a cost of 135,436*l*., in six more municipalities.

WHILST laying the gas-mains in Wakefield Road, Brighouse, last week, two workmen were entombed by the collapse, without warning, of a high stone-built boundary wall. George Mayne, New Street, Batley, was taken out dead, but William Bull, Batley, was only slightly injured on the leg and arm. Both are married men and Mayne has a grown-up family.

LEA BRIDGE, which joins the counties of Middlesex and Essex, has been rebuilt by the London County Council, and the new structure is now open. The old bridge, which was erected in the latter part of the last century, interrupted the river traffic; the new one admits of two barges passing abreast, and is constructed largely of web-plate girders, giving headway of 7 feet 4 inches. The cost amounts to 8,399*l*.

147 STRAND, LONDON, W.C.

THE new post office which has just been built at Lydney, at a cost of 2,000*l.*, was formally opened on July 31. The building was erected by Messrs. Kear & Son, from plans by Mr. Howard Howells, of Lydney. The new premises contain excellent accommodation for post office work in all departments. In the rear is the residence of the postmaster, Mr. A. H. Harrison, from whom the site was purchased.

MR. COOPER, general manager of the Glasgow and South-Western Railway Company, and other officials, visited Port-Glasgow on August 2, where they were met by Provost Rodger, the town clerk, and several members of town council, for the purpose of examining the ground near to the line of rails of this company running past Port-Glasgow, with the object of recommending a suitable site for the construction of a passenger station. The town council unanimously voted in favour of the new station, and in doing so represented the wishes of the community.

THE work of repairing the tower and spire of Salisbury Cathedral is being rapidly pushed forward, and Sir A. Blomfield, the architect, believes that by the new year the scaffolding will have been removed. He has informed the Dean and Chapter that the turret at the north-west side of the cathedral was in such a bad state that it would be necessary to have it rebuilt. The Rev. G. D. Boyle, the Dean of Salisbury, declares that every stone that could be used again "appears in its proper place, only new stones being introduced wherever the original stones had been crushed or broken."

AN important addition to London's suburban theatres has just been built at Crouch End, and is to be known as the Queen's Opera House. The new building is a commodious structure admirably adapted for its purpose and position. It covers over one-third of an acre. The auditorium is 100 feet by 54 and the stage 54 feet by 30. There is accommodation for 1,500 persons, including 100 in the orchestra stalls, 236 in the pit stalls and 436 in the pit. Above there is a large balcony. Four boxes add to the appearance of the house, which has been decorated by Messrs. Dean, of Birmingham. Mr. Tom Woolnough is the architect and Mr. Frank Matcham the consulting architect. The saloon and lounge is 50 feet by 27. The building has cost 12,000*l.*

THE Hôtel Burlington, which has been recently opened at Dover, is of noble proportions, and faces the centre of the bay, being set back a little from the Marine Parade; but the houses which intervene are to be cleared away, so as to give an un-

impeded view of the Channel from every part of the building. The hotel contains 380 rooms. Opening out of the grand hall, which forms the lounge of the hotel, and which is fitted as an Oriental divan, with some fine Indian carvings forming structural screens and portières, and can also be utilised as a ball or concert-room, are some beautifully decorated and richly upholstered apartments. Long corridors traverse the three wings of the hotel, and on the upper floors give access to the bedrooms and private suites. They are furnished in every style, French and English, the best periods of each having been selected to please the educated sense. The sanitation, ventilation and lighting of the hotel are carried out on the latest systems. The architects are Messrs. Murray & Foster.

AN accident of a serious character has occurred on Kew Bridge. A heavily-laden furniture van, belonging to Mr. T. Morris, of High Road, Chiswick, was being driven from the Surrey to the Middlesex side, and when just on the crown of the bridge the driver saw that, owing to the steep gradient, a collision with two carts stationed lower down the incline was inevitable. In his endeavour to avoid the collision he pulled his horses sharply on to his off-side, with the result that the animals got on to the footpath and the centre pole of the van came violently into contact with one of the balustrades, which was knocked over. The force of the impact caused a rebound and another collision, in which more balustrades went over. For a few moments it looked as if the horses must drag the van and driver over into the river, but happily the animals were got under control in time to prevent that disaster. Mr. N. Parr, the surveyor to the Brentford District Council, on being informed of the accident, made arrangements for scaffolding to be erected at the damaged portion of the bridge.

TRADE NOTES.

THE new Cottage Hospital, Accrington, is being warmed and ventilated by means of Shorland's patent Manchester grates.

THE date for the second International Furnishing Trades Exhibition is fixed for March 18 to 29, 1898. This is somewhat earlier than last year's date, but the time is altered at the request of a large number of exhibitors, who are of opinion that more orders will be placed in the month of March than at any other time.

"Amongst the showrooms of our trade throughout the country, few (if any) excel in spaciousness and dignity those of Messrs. Sparrow & Son, of Nottingham." — *Journal of Decorative Art*, August, 1896.

Park Row, Nottingham.

THE CONCILIATION ACT, 1896.

THE first report by the Board of Trade of proceedings under the Conciliation (Trade Disputes) Act, 1896, has been published. It opens with the following letter to the President of the Board of Trade from the Permanent Secretary:—

July 12, 1897.

Sir,—I have the honour to present the first report of the Board of Trade under the Conciliation Act, 1896. Under the Act the Board are from time to time to present a report to Parliament of their proceedings, and it has been thought desirable to record the Board's experience of the working of the Act without waiting the completion of twelve full months from its passing.

The administration of an Act so largely dependent for its success upon the actions of persons other than the officers of the Department must be tentative, and it is far too soon yet to judge of its full influence on the prevention and settlement of trade disputes. The fact, however, that thirty-one applications have been made for the assistance of the Department in about ten months shows a willingness to rely upon the good offices of the department in conducting negotiations which is of considerable promise for the future.

The experience gained in working the Act clearly establishes, in my opinion, one important fact, namely, that in a large number of disputes, when a meeting between the parties can be arranged, great benefit follows from the presence of an impartial person able to mediate, to prevent the effect of personal asperities, to make suggestions and to facilitate concessions. It is to be noticed also that negotiations with a mediator may tend to encourage the parties to arrive at a settlement by themselves.

It will be seen from Mr. Llewellyn Smith's report that of the thirty-five disputes in which some kind of action by the Board of Trade has been either taken or invited nineteen have been settled under the Act by conciliation or arbitration. The greater number of these cases have been settled by conciliation, but during the period under review there have been five cases of actual arbitration under the Act—four the result of joint application and one in which, under an agreement effected by conciliation, I myself was appointed by the parties to determine certain points.

The arbitrators hitherto appointed have been Sir William Markby, K.C.I.E., in two cases, Sir David Dale, Mr. Thomas Bell and Captain Wilson. The hearty thanks of the Board of

Trade are due to these gentlemen for the readiness with which they placed their valuable services at the disposal of the Board, as well as to Sir Horatio Lloyd, county court judge of Chester, who, acting as conciliator and not as arbitrator, procured a settlement in a complicated dispute in North Wales, and to Mr. W. E. Willink and Mr. Baillie Dun, who acted at the request of the Board as chairmen at conferences and otherwise.

If the tendency to use the Act grows the Board of Trade will have to rely more and more on the assistance and services of such gentlemen in completing negotiations, the preliminary stages of which may be usefully conducted by the officers of the Department.

It is as yet impossible to predict how far the Act is likely ultimately to succeed; but I repeat that the experience gained in the Department shows that advantage has been found, and may be expected to be found, from negotiations conducted by independent persons whose only object is the termination of disputes which must be injurious to trade.

I have the honour to be, Sir, your obedient servant,
COURTENAY BOYLE.

The Labour Commissioner, Mr. Llewellyn Smith, explains the proceedings taken under the Act from August 7, 1896, when it became law, up to the end of June last. The duties cast upon the Board of Trade by the Act were twofold—the encouragement and extension of the work of voluntary conciliation boards and the settlement, under certain conditions, of actual disputes between employers and workmen. Hitherto the action of the Board under the latter head has been, it is stated, on the whole the more important. Of the thirty-five cases in which, as Sir C. Boyle states, action was taken or invited, applications were received from one or both of the parties in thirty-one disputes, while in the remaining four cases action was taken by the Board of Trade without formal application by either party. In twenty-six cases there was an actual cessation of work. Seven of the applications were refused, action of some kind being taken in the remaining twenty-eight. One of these cases is still pending. Of the remaining twenty-seven, nineteen were settled through proceedings under the Conciliation Act and four were settled between the parties during the negotiations, while in four the efforts of the Department were unsuccessful.

Among the cases the following were connected with building:—

Bricklayers and Plasterers at Newcastle-on-Tyne.

There had been a long-standing dispute between the bricklayers and the plasterers at Newcastle-on-Tyne as to the limits of work belonging to the respective trades in respect of the laying of cement flooring.

In 1893 the matter was referred by the Bricklayers and Plasterers' Societies to the arbitration of the Tyneside Building Trades' Federation, the decision being that the work belonged to the plasterers, except jobbing builders' repairs or sanitary work, which might be done by either party. Difficulties, however, arose with regard to the working and interpretation of the award, leading to stoppage of work. On March 30, 1896, the employers belonging to the Newcastle, Gateshead and Tyne District Master Builders' Association locked out both plasterers and bricklayers. The latter, however, came to an understanding with the employers on the basis of leaving the arrangement of the work in dispute to the discretion of the employer. The plasterers remained out, and claimed that the former award should be maintained. They also demanded an advance of $\frac{1}{4}$ d. per hour in wages. An unsuccessful attempt was made on June 8 by the Newcastle and Gateshead Trade and Labour Council to effect a settlement of the dispute, but though the plasterers offered to accept arbitration the bricklayers refused. Matters remained in this state for some time, most of the workmen affected having found work elsewhere.

On November 4 an officer of the Department visited the district and had interviews with the parties affected. On the following day he presided over a conference of representatives of the two societies, at which the matters in dispute were thoroughly discussed. It was not, however, found possible to effect a settlement by mutual agreement, and it was then suggested by the Board of Trade that the matter should be referred to an umpire appointed by mutual consent or nominated by the Board.

The proposal was duly placed before the members of both trade unions, with the result that the plasterers accepted and the bricklayers refused the proposal for arbitration. Subsequently personal interviews took place between officers of the Department and the secretaries of the Newcastle Master Builders' Association and of the Plasterers' Society, but without effecting a settlement.

The dispute was arranged in March 1897, at a conference consisting of two architects, two builders, two bricklayers and two plasterers. One of the architects, Mr. Dyson, presided.

This meeting resulted in an agreement under which the rights of each trade to do cement work were specifically defined.

Painters at Middlesbrough.

On March 1, 1897, a strike of painters at Middlesbrough began, the men demanding an advance of 1d. an hour and certain alterations in the working rules. Three months' notice of these demands had been given, but apparently no negotiations had taken place between the parties previous to the strike. The employers declined to submit the dispute to a board of conciliation in accordance with the working rules, claiming these rules to be void. They complained of the refusal of the workmen to agree to arbitration in a previous dispute. The men belonged to the local branch of the National Amalgamated Society of House and Ship Painters and Decorators; the employers to the Middlesbrough Master Painters. About seventy men were affected. The Mayor of Middlesbrough, at the request of the men, endeavoured to bring the parties together during the first week of the dispute, but the master painters declined to accept his services.

On March 22 the general secretary of the men's union applied to the Board of Trade to take action under the Conciliation Act. In reply the Department asked for further particulars, both with regard to the exact demands of the men for alteration of working rules and certain other matters having a bearing upon the questions in dispute. On obtaining this information an officer of the Department visited the district on April 1, and on that and the following day saw the principal parties to the dispute and presided at an informal conference of two representatives of each side. As a result, the master painters offered to have an open arbitration to fix the rate of wages, promising not to reduce them below the existing rate in the event of the arbitrator awarding a reduction. This offer was transmitted by the Board of Trade to the general secretary of the union, who promised to recommend its acceptance. The local members of the union, however, refused to agree to the terms of reference, claiming that the only legal notice which could be dealt with by an arbitrator was their application for an advance, the rules providing for three months' notice of a claim for advance or reduction. The masters, however, as stated above, regarded the rules as having lapsed.

On April 22 a letter was received from the general secretary of the union stating that a further attempt at direct negotiations between the parties had been made, but that the conference broke up without result. On April 28 another officer

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact, it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

of the Department visited the district and had an interview with the men's representatives, with the result that on the following day they agreed to accept the original offer made through the Board of Trade by the employers. This was communicated to the employers, who, however, on May 4 declined to renew the offer or to entertain any further negotiations. The dispute has not been settled.

Carpenters and Joiners at Prescott (No. 1).

On May 3, 1897, a dispute took place affecting carpenters at Prescott, near Liverpool. The works on which these carpenters were engaged were situated within the ten-mile radius from Liverpool landing stage, and so within the area covered by the working rules of the Liverpool district, agreed to in 1895 between the Liverpool Master Builders' Association and the Liverpool District Committee of Carpenters and Joiners. These rules, providing for a rate of wages of 9d. an hour, were not at the time enforced in the Prescott district, but in November 1896 the carpenters gave the master builders six months' notice of their intention to enforce them. Four of the builders in the district declined to sign the rules, and the strike took place at these firms. Mr. F. Brown, the largest of the employers affected, offered arbitration, but this the men declined, as they considered that it would prejudice the position of their members already working under the rules. The employer, however, claimed that he was governed by the St. Helen's rules.

On May 20 Mr. Brown applied to the Board of Trade to endeavour to bring about a settlement. Accordingly an officer of the Department visited the district on May 25, and had interviews with the representatives of the parties. As a result, both sides agreed to take part in a conciliatory conference under the presidency of a neutral chairman.

At the request of the Board of Trade, Mr. W. E. Willink, architect, of Liverpool, consented to preside at the conference, which took place on May 28, there being present three representatives of each side, together with the officer of the Department. As a result the following agreement was arrived at, and the men returned to work:—

As a settlement of the difficulty between Mr. Fred Brown and his joiners in respect to the conditions of working, Mr. Brown agrees to conform to the working rules of the Liverpool, Birkenhead and District Building Trades while working in the Liverpool, Birkenhead and district area.

FRED BROWN.
W. E. WILLINK
(Chairman of Conference).

Carpenters and Joiners at Prescott (No. 2).

The circumstances of the dispute affecting carpenters and joiners at Prescott are described above. The settlement effected at the conference, over which Mr. Willink presided on May 28, only included one out of four employers.

On June 16 a further application was made to the Board of Trade, on behalf of the three remaining employers affected, for assistance in bringing about a settlement of the dispute. At the request of the Board of Trade Mr. Willink undertook to act as conciliator, and on June 30 had an interview with the three employers. As a result of this interview the employers agreed to conform to the working rules of the Liverpool district, and promised to communicate their decision to the trade union officials.

Masons at Huddersfield.

On May 1, 1897, the masons at Huddersfield, to the number of about 200, struck work, their demands including a rise of wages and a revision of the local working rules. Previous to the strike negotiations had taken place between the local branch of the Operative Stonemasons' Friendly Society and the Huddersfield Master Masons' Association, but the parties were unable to agree with regard to a rule, proposed by the men, that no wallstone dresser, quarryman, or bricklayer should be allowed to do mason's work, and the strike therefore took place. On May 31 a communication was made to the Board of Trade by the Mayor of Huddersfield, asking, on behalf of the Master Masons' Association, that the Board of Trade should appoint a conciliator or board of conciliation under section 2 (1) (c) of the Conciliation Act. In consequence of this application an officer of the Department visited Huddersfield, and had an interview with the representatives of the men on June 4, with a view of making further inquiries, and of ascertaining how far the appointment of a conciliator would be likely to promote a settlement of the dispute. He was informed that the great majority of the strikers had obtained work elsewhere, and also that while not desirous of outside intervention, they were prepared to meet the employers if invited to do so by them. Under these circumstances the Mayor was informed that the possibilities of direct negotiation between the parties did not appear to be exhausted, and that it did not seem that any useful purpose would be served by appointing a conciliator at the present stage. Direct negotiations have accordingly been opened up between the parties.

ROCK-CUT TOMBS, TEMPLES, AND HABITATIONS.*

(Continued from last week.)

WE will now turn our attention for a few minutes to the consideration of rock-cut tombs in Asia Minor which were probably the work of the early Greek settlers; if so they brought the custom with them from Egypt or borrowed it from the Egyptians. There is a curious group of rock-cut monuments found at Doganlu. They are placed on the rocky side of a narrow valley and are not apparently connected with any great city or centre of population. Generally (says Fergusson), they are called tombs, but there are no chambers nor anything about them to indicate a funeral purpose, and the inscriptions which accompany them are not on the monuments themselves, nor do they refer to such an object. They are among the most mysterious remains of antiquity, and beyond a certain similarity to rock-cut tombs around Persepolis, present no features that afford even a remote analogy to other monuments which might guide us in our conjectures as to the purpose for which they were designed. They are of a style clearly indicating a wooden origin and consist of a square frontispiece either carved into certain geometrical shapes or apparently prepared for painting. At each side is a flat pilaster and above a pediment terminating in two scrolls. Some—apparently the more modern—have pillars of a rude Doric order and all, indeed, are more curious than beautiful. Judging from the inscriptions on them and the traditions of Herodotus, they would appear to belong to some race from Thessaly or thereabouts, who at some remote period crossed the Hellespont and settled in the neighbourhood; they may date as far back as 1,000, and in all probability at least 700 years before the Christian era.

Another important group in Asia Minor is that at Lycia, an account of which was published in 1838 by Sir Charles Fellows. They appear to indicate a wooden origin; the oldest of them cannot well be carried back further than the Persian conquest. It seems quite evident that prior to that event the Lycians used only wood for their buildings, and that it was only at that time, and probably from the Greeks or Egyptians, that they, like the Persians, learned to substitute for their frail and perishable structures others of a more durable material.

It is worthy of note that it is only in the infancy of a country that its inhabitants adhere to wooden forms of con-

struction, and as soon as habit and improved conditions of society give them familiarity with the use of more durable material they abandon the incongruities incident to wooden construction and soon lose all trace of original forms. All the original buildings of Lycia are tombs or monumental erections of some kind, and generally may be classed under two heads, those having curvilinear and those having rectilinear roofs, of which both classes are found, some of which are structural (standing alone), and some of which are rock-cut. One example is that of a perfectly constructed tomb rock-cut, with a façade similar in design to a structural edifice, having the outline of a curvilinear roof cut in the solid rock. Other examples were found having a pediment wrought in the rock above the entrance to the tomb. One very beautiful one was in imitation of an Ionic portico, having on each side two heavy pilasters, and between the pilasters two Ionic columns, the whole surmounted by a fairly good Ionic pediment.

Similar in many respects are the rock-cut tombs of ancient Etruria, the most remarkable of which is at Corte d'Asso. At this place there is a perpendicular cliff with hundreds of these tombs ranged along its face like houses in a street. A similar arrangement is found at Beni Hassan, Egypt, at Petra and Cyrene and around all the more ancient cities of Asia Minor.

In Etruria they generally consist of one chamber lighted by a doorway only. Their internal arrangement appears to be an imitation of a dwelling chamber with furniture like the apartment itself cut out of the solid rock. Externally they have little or no pretensions to architectural decorations. Some of the tombs are found adorned with fronts of a debased Doric or Ionic order; but these were executed at a much later period and under Roman domination, and hence cannot be taken as specimens of Etruscan art, but rather of that corruption of style sure to arise from a conquered people trying to imitate the arts of their rulers. Our time will not permit us to pursue this interesting topic further and we will turn our attention to the consideration of the second division of our subject, namely, "rock-cut temples."

With the exception of a few rock-cut temples in Nubia previously alluded to; it does not appear that the ancient Egyptians employed this method of construction for their sacred edifices. Like all rock-cut examples the world over, the Nubian temples are copies of structural buildings, only more or less modified to suit the exigencies of their situation, which did not admit of any very great development inside, as light and air could only be introduced through the one opening of the doorway. The prin-

OFFICE: 175 STRAND, LONDON, W.C.

cial examples of this class of monuments are the two at Ipsamboul, the largest of which is among the finest of its class known to exist anywhere. Its total depth from the face of the rock is 150 feet, divided into two large halls and three cells with passages connecting them. Externally the façade is about 100 feet in length, and adorned by four of the most magnificent colossi in Egypt, each 70 feet in height, and representing the king, Rameses II., who caused the excavation to be made. It may be because they are more perfect than others found in that country, but certainly, says Fergusson, "nothing can excel their calm majesty and beauty or be more entirely free from the vulgarity and exaggeration which is generally characteristic in colossal works of this sort." The smaller temple of the same place has six standing figures of deities countersunk in the rock and is carved with exceeding richness. It is of the same age as the larger temple, but will not admit of a comparison with it owing to the inferiority of its design. Besides these there is a very beautiful though small temple at Kalabsche, likewise belonging to the period of Rameses II., and remarkable for the beauty of its sculptured bas-reliefs as well as for the bold proto-Doric columns which adorn its vestibule. There are also smaller ones at Derri and Balagne at the upper end of the valley. At Essabua, Gissheh and Dandour the cells of the temple have been excavated from the rock, but their courts and pylons are structural buildings added in front—a combination never found in Egypt, and very rare anywhere else, although meeting the difficulties of the case better than any other arrangement, inasmuch as the sanctuary has all the imperishability and mystery of a cave, and the temple has at the same time all the space and external appearance of a building standing in the open air. This arrangement is found also to exist at the temples of Gibel Barkel, in the kingdom of Meroe, showing how far the rock-cutting practice prevailed in the upper valley of the Nile.

As all these temples are contemporary with the great structures in Egypt, "it seems strange," says Fergusson, "that the eternity of rock-cut examples did not recommend this form of temple to the Egyptians themselves, but with the exception of a small grotto near Beni Hassan and two small caves near the cataract of the Nile, the Egyptians seem never to have attempted it, trusting apparently to the solidity of their masonic structures for that eternity of duration they aspired to."

The most important examples of rock-cut temples are to be found in India. These examples can hardly be regarded as

belonging to ancient architecture. The traditions as to the extremely remote antiquity of the rock-cut temples and caves of Ellora, and the wonderful pagodas, have disappeared before the searching eye of critical investigation. Instead of being of almost diluvian antiquity, as was generally supposed, they have been proved to date from the seventh or eighth century of our era, while the most recent is the work of India-dymna as late as the twelfth century. One of these temples at Karli, near Bombay, presents exactly the features of a Roman basilica, or early Christian church. It has a circular end or apse, and is divided into three aisles by two rows of columns. Others are simple square buildings with a circular or oval chamber at the end entered by a small door.

(To be concluded.)

PATENTS.

This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 17067. John William Craven, for "Improvements in brick-making machine."
- 17037. Benjamin Ferriss, for "Rail fasteners."
- 17058. John Shanks, for "Improvements in the discharge apparatus of water cisterns."
- 17096. Edwin Joshua Clayton, for "Improvements in window-shade attachments."
- 17206. Clarence Robert Heckford and Herbert Bagnall, for "Improvements in locks."
- 17230. Edward Mountjoy Price, for "A nautical level floor."
- 17243. John Owden O'Brien, for "Improvements in fire-bars."
- 17264. George Samuel Heath, for "An improvement in French windows and doors."
- 17308. Wolfe Mainzer, for "Improved method of hanging and fixing metal window-casements."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—For taking-down cottages and erecting stables. Mr. J. H. Turner, Margaret Street, Ashton-under-Lyne.

AUDENSHAW.—For taking-down and rebuilding the Liberal Club. Mr. J. H. Burton, architect, 2 Guide Lane, Hooley Hill.

BATLEY.—For erection of five villa residences at Wilton Park. Mr. Walter Hanstock, architect, Leeds.

BEDFORD.—Aug. 17.—For alterations and additions to Board school at Oakley. Mr. M. Sharman, 6 St. Paul's Square, Bedford.

BELFAST.—For erection of nine houses, stores, &c., in Downing Street. Mr. D. M. Cooper, 47 Donegall Place.

BELFAST.—For erection of two houses, Wellington Park. Messrs. Forman & Aston, architects, Queen's Buildings, Royal Avenue, Belfast.

BELFAST.—Aug. 18.—For building new church in connection with Albertbridge Congregational Church. Messrs. Frazer & Son, architects, 117 Victoria Street, Belfast.

BELFAST.—Aug. 28.—For erection of a house on the Antrim Road. Mr. James A. Hanna, architect, 102 Donegall Street, Belfast.

BILLERIGAV.—Aug. 17.—For repairs to the windows and window-frames at the workhouse. Mr. Charles Edgar Lewis, clerk, Brentwood.

BRADFORD.—For erection of a clear ice factory, cold storage and chill rooms. Mr. Fred Holland, architect, 11 Parkinson Chambers, Hustlergate, Bradford.

BRENTWOOD.—Aug. 18.—For providing and fixing a movable floor over the swimming-baths at the Hackney Union Schools. Mr. Frank R. Coles, clerk, Homerton, N.E.

BRIDGEND.—Aug. 25.—For erection of a temporary wood and iron block to accommodate 100 patients at the Parc Gwyllt Asylum. Messrs. Giles, Gough & Trollope, architects, 28 Craven Street, Charing Cross, London.

BRIDLINGTON.—Aug. 17.—For taking-down of a cottage and other buildings and erection of a workshop and other buildings, on the east side of St. John Street. Mr. Samuel Dyer, architect, Quay Road.

BRIXWORTH.—For building infants' school. Mr. John Ingman, architect, Abington Street, Northampton.

BROCKLESBY.—Aug. 16.—For erection of Church institute and Sunday-school, near the church at Keelby, near Brocklesby, Lincs. Rev. N. L. Browne, Keelby.

BURNLEY.—For erection of stables, coach-house, &c., at Reedley. Mr. Charles Parsons, architect, 9 Grimshaw Street, Burnley.

BURTON-ON-TRENT.—For erection of a Wesleyan chapel at Church Gresley. Mr. Robt. Clarke, architect, Prudential Buildings, Nottingham.

CARDIFF.—Aug. 28.—For erection of a truant industrial school near Dinas Powis. Mr. W. H. Dashwood Caple, 1 St. John Square, Cardiff.

CHELMSFORD.—Aug. 17.—For erection of an engine-house on land in the market-place. The Borough Surveyor, 14 Museum Terrace, Chelmsford.

CHELTHENHAM.—Aug. 28.—For erection of school buildings opposite the Lyefield Schools, Charlton Kings, and for alterations to the present buildings. Mr. James Villar, architect, 1 Cambray, Cheltenham.

CHICHESTER.—Aug. 18.—For alterations and improvements at the workhouse. Mr. Edward Arnold, clerk, Chichester.

CLITHEROE.—For altering roof and providing new seating, &c., at St. Mary's Parish Church. Messrs. McCall & Robinson, 7 Tackett's Street, Blackburn.

COCKERMOUTH.—Aug. 16.—For providing and erecting a tool-house in the park for the Urban District Council. Mr. John Fearon, clerk.

COLNBROOK.—Aug. 16.—For erection of boys' school and alterations to infants' school. Mr. Thos. Potter, architect, 49 London Road, Sevenoaks.

CORK.—Aug. 26.—For erection of temporary buildings at Cork District Lunatic Asylum. Mr. W. H. Hill, 28 South Mall, Cork.

CORK.—For carrying out of structural alterations, 13 Beach, Queenstown. Mr. Nat Jackson, 13 Beach, Queenstown.

DERBY.—Aug. 23.—For the brickwork for six refuse-destructor cells, for the Corporation. Mr. R. J. Harrison, borough engineer, Babington Lane, Derby.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

NEW CATALOGUE.

MESSRS. MATTHEWS & YATES, LIMITED, of Cyclone Works, Swinton, near Manchester, are sending out a new issue of their catalogue of blowers, electrical goods and other specialties. It contains some excellent illustrations of the "Swinton" dynamos and motors, "Cyclone" electric blower and exhaustor for ventilating purposes, with and without combined steam-engine, electric fans, &c., with descriptive text, price list and other useful information.

THE "X.L." AUTOMATIC DISINFECTANT JAR.

ALTHOUGH the notion largely prevails that it is only necessary to use disinfectants in hot weather, the idea is obviously an erroneous one, as it is in fact in the winter-time, when our houses are closely shut up and fires are in full swing, that the injurious effects of sewer-gas are most likely to be experienced. It therefore behoves the householder to be at least as careful in the winter as in the summer to keep the drains well flushed and disinfected. As a means of doing this both inexpensively and efficiently we have pleasure in saying a few words in favour of the "X. L." automatic disinfectant jar which is being put on the market by the British Druggists, Limited, of 219 Oxford Street, W. It is a simple little contrivance, in the form of a cylinder of porous earthenware, filled with permanganate crystals, creosolic or pinetic fluid, eucalyptus or carbolic acid and hermetically sealed. When placed in the flush-tank of w.c. or lavatory the action of the water slowly dissolves the contents of the jar, with which the water is impregnated, so that with every flushing the drains are automatically disinfected. The contents of a jar, which costs 3s. 6d., are calculated to be sufficient for a year's constant use.

APPLICATIONS were received from twenty-seven architects to advise the Lichfield Guardians upon the proposed alterations and extensions to the workhouse. Mr. W. H. Woodroffe, London, was appointed. The workhouse, which is situated in the Trent Valley Road, was erected in 1840, and was designed by Sir Gilbert Scott. It is of picturesque appearance, in red brick and stone, and small windows with iron diamond-shaped casements, which for a workhouse are not conducive to healthy rooms, and though of quaint appearance are to be removed.

BUILDING AND BUILDERS.

THE memorial-stone of a new Baptist Sunday school at Earlestown was laid on the 5th inst. The school when completed will cost about 560*l*.

THE foundation-stone of a new Congregational church in Farrar Street, Barnsley, was laid on the 5th inst.

THE ceremony of laying the foundation-stone of St. Mary's new Roman Catholic church, Eccles, will be performed on Saturday, 28th inst.

PLANS have been passed for the erection at Springwells, Airdrie, of an Episcopal church which will accommodate 200, including the choir. The building will be Gothic in design.

THE foundation-stone of the new Radcliffe Hall National Schools, which are being built in connection with the Radcliffe parish church, was laid on Saturday afternoon. The schools are expected to cost between 2,000*l*. and 3,000*l*.

THE plans for the technical school buildings have been received by the town clerk of Bootle, Mr. J. H. Farmer. The site chosen for the buildings is at the corner of Pembroke and Balliol Roads, which will be a most central position and conveniently situated. The estimated cost of the new Technical Instruction School building is 16,800*l*., the amount required for furnishing being included in that sum.

AT the pretty and historic church of St. Chad's, Over, near Northwich, the foundation-stone was recently laid of two new vestries and an organ transept, which are being built at a cost of nearly 1,000*l*. This is the first time since the year 1543 that the fabric of this ancient church, which dates from the reign of Edward I., has been substantially enlarged. For more than 350 years its walls have stood very much as they are to-day.

AT a meeting of the Rowley Vestry it was resolved to apply to the Consistory Court of the Diocese of Worcester for a faculty to collect funds to enable them to build a chancel to north and south transepts of the parish church, springing therefrom a gallery for the accommodation of the organ, and, further, a heating chamber in the base, while on the ground-floor vestries will be erected. This block of buildings will be attached to the existing church, of which, on being consecrated, it will become a part, and will be the first instalment of an entire new church. The committee were also to be empowered to take down the church as soon as they had sufficient funds and build a new church and tower on the same site. The resolution was carried with one dissident.

VARIETIES.

THE new church of St. Matthew's, Douglas, has recently been opened for Divine service.

IT is believed that the contractors of the new North Bridge, Edinburgh, have received instructions to have the work completed at the end of August.

THE nave at Swansea parish church, which has been rebuilt at a cost of 14,000*l*. from designs by Sir Arthur Blomfield, was opened on the 5th inst.

MR. GEORGE FRATER, varnish manufacturer of Newcastle, who left for a tour in Switzerland on the 2nd inst., has been found in an unconscious condition on the road from Annemasse to Geneva. His pockets had been rifled of all his money. He was taken to an hotel, where he died. Mr. Frater's son has left Newcastle for Switzerland to make a searching inquiry into the affair.

THE board of directors of Drury Lane Theatre have decided to have the interior and exterior of the theatre redecorated, a new fireproof curtain put in, and certain other improvements carried out previous to the opening next month. The work is being done under the supervision of the architect, Mr. Philip E. Pilditch.

RUMOUR says that the purchaser of the Sandlea Estate, near Windsor, at the recent auction at Tokenhouse Yard, was Her Majesty the Queen. The best offer before the fall of the hammer was 11,500*l*., which was not a bad price, considering that the lands only comprise sixteen acres, and the house is a very ordinary structure. It has a frontage of about 900 feet to the Thames.

AT a meeting of the directors of the Aberdeen Granite Association on the 4th inst. it was reported that the American Tariff Bill, which had now become law in the United States, had raised the duty on Aberdeen granite from 30 to 50 per cent. There was a feeling that prices were likely to rise on the other side, so that the increase in the tariff would in that case make comparatively little difference in the export trade of Aberdeen.

A NEW reservoir, constructed by the Corporation of Perth, was opened on the 9th inst. at Burghmuir, two miles from Perth. The reservoir is erected at an elevation of 320 feet, which is an altitude sufficient to supply all the higher districts round the outskirts of the city for many years to come. The size of the reservoir is 121 feet square, by 21 feet 9 inches deep. The reservoir when full holds 1,956,084 gallons, being 117,300 gallons more than the existing three reservoirs hold when full.

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

THE construction will be commenced almost immediately of a new quay in Brindisi Harbour, alongside which the Peninsular and Oriental steamers will be moored. This new quay will adjoin the harbour railway station, and travellers will thus have only a short way to go between the ship and the train. The quay will be roofed the whole distance from the steamer berth to the station. Plans are being considered for reducing the time of transit between Brindisi and Calais.

SOME time ago two pinnacles were promised for vacant spaces above the chancel of Bury (Lancashire) parish church, and four others were promised by Mr. J. Kenyon, M.P., Colonel O. O. Walker, Mr. J. Aitken and the rector of the parish (the Rev. F. G. Blackburne), on condition that the eight which were required were completed. At the last meeting of the churchwardens and sidesmen the rector offered to give another if the wardens and sidesmen would be responsible for the last out of the church funds. This offer was accepted, and the work is to be put in hand at once, the total cost being nearly 500l.

THE new free library, Burton-on-Trent, is now open to the public. The building is situated in Union Street, and is that which was formerly occupied by the Burton Institute authorities. Since it was taken over by the Corporation extensive alterations have been made and the latest improvements introduced. The fittings are for the most part pitch-pine, the partitioning being ornamented with fancy glass. The electric light has been installed, and the various rooms have been smartly painted and decorated, while the heating apparatus has been greatly improved.

A SERIOUS subsidence, which created much alarm among the church officials, recently occurred in the sanctuary of Dane Bridge parish church, Northwich. The floor was supported by arches, and the keystone and brickwork of one of these gave way owing to the sinking of the foundations caused by brine-pumping. A hole 6 feet long, nearly 4 feet wide and extending to the base of the building was caused. The cavity was planked over and hidden to prevent a panic among the worshippers. The porch, walls, &c., show large fissures, and the whole fabric has suffered considerably. A further subsidence is feared, and entire rebuilding is necessary.

ANOTHER victim of the reprehensible practice of cleaning windows from the outside narrowly escaped a shocking death on Monday last. He was cleaning the windows of a large seven-storey building in Major Street, Manchester, when he fell from the topmost storey into the street. A lorry laden with

Manchester goods happened to be passing, and, alighting upon this, he rebounded and rolled on to the pavement. Had his fall not been thus broken he would inevitably have been killed. He was able to raise himself partially without assistance, and upon being taken to the Royal Infirmary it was found that he was suffering from shock, but it was not considered necessary to detain him as an in-patient.

ST. CATHERINE'S CHAPEL OF EASE, Donore Avenue, South Circular Road, Dublin, was used for Divine worship for the first time on Sunday morning, when the building was opened by His Grace the Lord Archbishop of Dublin at half-past eleven o'clock. The church, which is situated at the corner of Donore Avenue, facing the South Circular Road, and the erection of which cost upwards of 2,000l., is admirably placed, and the attractive plans which were prepared for it have been well carried out. The result is a chapel in every respect worthy of the sacred work to which it is dedicated. The edifice is in the Pointed style in red bricks. Accommodation has been provided for 1,000 persons, but the work has been executed in such a way as to enable additions to be made to the structure without difficulty, as occasion may demand. The roofing of the chapel is elegant and substantial, and the seating and furnishing appropriate. The building stands in from the roadway, from which it is railed off, and the principal entrance is approached by a flagged pathway; there is a second entrance in the southern transept. The decorative work is simple and effective.

A DISASTROUS fire occurred on August 8, in the station buildings at Lochawe, N.B. The fire was first observed a few minutes before nine o'clock, and spread so rapidly that before either hose could be brought into use the station was in flames from end to end. The hotel is built upon a rock facing the west end of the station platform, is connected with the platform by a bridge over the railway, and immediately facing the platform, and in the hotel ground is a shrubbery. The hotel people, finding that all efforts to save any part of the station buildings would be useless, directed their attention to saving the overbridge and the shrubbery, as, if the latter had caught fire, the hotel would be in serious danger. The guests in the hotel lent willing help, and were successful in preventing the fire spreading in the shrubbery, although many of the trees and bushes were destroyed. The station buildings were erected in 1880, when the railway was carried through to Oban, and were constructed in Swiss chalet style of pitch pine on a concrete foundation.

THE SANITARY INSTITUTE.

AT the sessional meetings of the Sanitary Institute from April to June 1897 the following were the examination questions:—

Practical Sanitary Science.—Birmingham, April 9 and 10.

PAPER I.

1. How is rain-water stored and filtered for delivery to towns?
2. Find the cubic contents of a room 20 feet square and 12 feet high, having a flat ceiling, with a hemispherical dome in the middle 10 feet in diameter.

3. What provisions are desirable with regard to window-space in living-rooms? State the sanitary advantages and disadvantages of the various kinds of windows in general use. In what way can any of these forms of windows be adapted for the purpose of ventilation?
4. State the relative advantages and disadvantages of heating by open fireplaces and by stoves. Describe and sketch a good form of open fireplace and a ventilating close stove.
5. Name four soils and compare their advantages or disadvantages as sites for dwelling-houses. Would the stratum immediately underlying the soil affect the question?

PAPER II.

6. What is the object of a "damp-proof course"? Give sketches showing in what position it should be placed to meet various conditions, and state the materials of which it may be constructed.
7. Draw in section, to a scale of 1 inch to a foot, walls of the following materials:—(a) Brickwork, English bond, one

brick thick and two bricks thick; (b) brickwork, Flemish bond, two bricks thick; (c) stone rubble; (d) concrete.

8. Describe and give a sketch plan of the drainage of a cowshed which is built upon a clay soil, 25 feet from a stream, which must not be polluted, and where there is no sewer available.

9. Describe the methods used for jointing iron pipes and for jointing stoneware pipes. How may iron pipes be protected from corrosion? In what circumstances are iron pipes preferable to stoneware pipes?

10. Describe, with sketches, the best methods of providing for drainage from w.c.'s, sinks, baths and rain-water pipes. What arrangements should be made to prevent sewer-gas entering into dwellings?

Practical Sanitary Science.—London, May 7 and 8.

PAPER I.

1. Describe the principle and action of a mercurial barometer. How much heavier is mercury than water, and at what height will a column of water be balanced by the pressure of the atmosphere?
2. Upon what conditions do the fluctuations of ground air and ground water depend? In what way do ground air and ground water affect the healthiness of dwelling-houses?
3. Describe fully the best form of domestic filter with which you are acquainted, its method and rate of action, and its effects on water passed through it.
4. What would be the internal dimensions of hollow cubes containing respectively 300 and 1,000 cubic feet of air space? Why is floor area in inhabited rooms important?

PAPER II.

5. Enumerate the different methods of artificially heating living-rooms, describing in each case the changes they may produce in the air of the rooms.
6. State the general provisions of the statute law providing for the abatement of smoke nuisances.
7. Describe the manufacture and methods of testing Portland cement. Of what geological formation is Portland stone? Specify the composition of good Portland cement concrete.
8. What is the object of an oviform section of sewer, and how is the hydraulic mean depth of flow determined?

LIGHTNING CONDUCTORS

IN PATENT COPPER ROPE OR TAPE.

NEWALL'S CONDUCTORS

Are the most reliable, most effective, and cheapest offered to the public.

Sole Manufacturers of Vyle's Patent (Easily Tested) Lightning Conductors.

Fixed complete by experienced workmen and their efficiency tested by competent electricians.

Vol. LVII. of THE ARCHITECT. Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.

REAP'S PATENT DETACHABLE HANDLE TROLLEY.

For Banks, Warehouses and Newspaper Offices. Is used at the London and County Bank, at Head Offices and Branches; at the Alliance Bank, London and Lancashire Offices, and at Messrs. George Newnes & Co.'s Newspaper Offices. These Trolleys are supplied with Rubber Corners to avoid collision with doors, fittings, &c., and can be placed in lift with handle removed. Particulars and Estimates on application to Sole Manufacturers, J. REAP & CO., Engineers, Ironfounders, and Pattern Makers, 16 Colindale Street, Southwark, S.E.

Practical Sanitary Science.—York, June 18 and 19.

PAPER I.

1. At what temperature does water boil at the level of the sea? Why does it boil? And is there any relation between that fact and the height to which an ordinary pump will lift water? If so, explain it.

9. How is rainfall calculated? How should a rain-gauge be constructed? What is the average rainfall in England? What is the ratio between rainfall and percolation through different strata?

3. Describe in detail the conditions which have to be observed to prevent the pollution of the domestic water supply within a dwelling.

4. Name the different kinds of bricks used in building. What are the relative advantages of each?

PAPER II.

5. Describe some system of warming and ventilation of a hospital, asylum, or public building, on a natural (as distinguished from a mechanical) principle, explaining the methods for the admission of pure and the extraction of vitiated air.

6. What are the legal duties of a private individual with regard to a dangerous infectious disease—e.g. scarlet fever—attacking a member of his family?

7. Draw to scale of $1\frac{1}{2}$ inches to 1 foot the following traps:—Disconnector, Dubois, Anti D., D., Bell, Dip.

8. A house-drain is 40 feet in length, 6 inches in diameter, and falls 1 in 20; at its upper end is a vertical pipe 4 inches in diameter. How many gallons of water will be required to fill the drain and vertical pipe to the level of 4 feet above the invert of the drain at its lower end?

Practical Sanitary Science.—Bristol, July 2 and 3.

PAPER I.

1. What are the component parts of (a) pure atmospheric air, (b) pure water? What are the usual sources of contamination of air and water in dwelling-houses? What is the natural law as to the diffusion of gases?

2. A ventilating shaft is 50 feet high and 18 inches square; how much air would ascend through it per minute when the temperature at the bottom is 20 degrees Fahrenheit greater than that of the atmosphere?

3. What is meant by the terms "Hydraulic mean depth"

—"Head of pressure"—"Specific gravity"—"Capillarity"—"Absorption"?

4. A reservoir is 30 feet in depth; what is the pressure on the bottom of the retaining wall in pounds per square foot, and at what depth is the centre of pressure?

PAPER II.

5. What are the chief causes of contamination of the subsoil of dwellings, and how can they be avoided?

6. Describe the properties and use of the following materials:—Portland cement, chalk lime, asphalté, oolites, lias lime, hair mortar, sandstone and granite.

7. What powers have a rural sanitary authority to make by-laws, and in respect to what nuisances are these limited? Can the Local Government Board increase these powers, and if so under what Act?

8. Describe the proper construction and fitting-up of a valve water-closet and a short hopper-closet, detailing the manner in which the water should be supplied, and the way in which the discharge pipes should be dealt with.

CARPENTERS' COMPANY PRIZES.

THE winners of the medals, &c., presented by the Carpenters' Company to students in the classes conducted under the auspices of the company and the council of the college are as follows:—Building construction, day classes, under Professor Fletcher.—Gold medal and 3/4, H. C. Bishop; silver medals and 2/4, E. F. Knight, A. J. West and C. W. Myddleton; bronze medals and 1/4, G. A. Turner, W. Shelley and A. E. Ruffhead. Evening classes.—Gold medal, J. G. Wiles; silver medals and 3/4, F. G. Pain, S. A. Switern and P. C. Blow (medal only); bronze medals and 2/4, C. W. Beaumont, C. J. T. Dadd, H. C. Bishop, H. Gloyne and W. Marchmont. Lord Mayor's medal for sanitary building construction.—A. Carter, J. Kent, S. A. Switern, T. Graves, J. Gough, W. Drake and C. J. T. Dadd have also won money prizes. All prizes of money are given in books to the value of the prize won. Wood carving classes (amateur).—Silver medals, Miss Carpenter, T. Ainsworth and John Dunn; bronze medals, L. A. Waldron and A. J. South. These medals are accompanied by scholarships tenable at the classes at King's College. The prizes will be presented at King's College on September 30.

SOHO COWL AND VENTILATOR

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to any one suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

NEW BATHS FOR SMALL HEATH, BIRMINGHAM.

THE baths and parks committee, in their report to the City Council, submit their proposals for the new suite of public baths for Small Heath, on land already secured adjoining the free library in Green Lane. The elevation of the proposed building conforms in character and style to the branch library. The first-class swimming bath, to be on the south side of the building, will measure 100 feet from front to back and about 60 feet in width. The water area of the swimming bath will be 81 feet by 33 feet wide, and will have a graduated depth of from 4 feet 6 inches at the shallow end to 7 feet at the deep end, and will contain about 90,000 gallons of water. The promenades on each of the four sides of the bath will be about 7 feet 6 inches wide, fitted on two sides and at one end with forty-four dressing-rooms. In addition a separate room will be provided for the use of swimming clubs. A public gallery or balcony will be constructed immediately over the dressing-rooms on both sides and one end of the bath, with separate stairs and entrance from the first-class corridor leading thereto. The second-class swimming bath on the north-east side of the establishment will measure about 97 feet from front to back and about 47 feet in width. The water area will be the same as the first-class bath, and the promenades on each side will be about 7 feet 6 inches wide, but there will be no dressing-rooms, as seats will be fixed against the walls, with partitions between each, giving accommodation for about 125 persons at one time. The men's first and second-class private baths are placed between the two large swimming-baths. Each department will contain seventeen private bath-rooms, and will be fitted up with the most improved white enamelled baths and hot and cold water services, showers and fittings. It is proposed to case the whole of the internal walls of the establishment throughout with white or tinted enamelled bricks, and the floors of the corridors and of the private bath-rooms will be laid in granolithic or mosaic pavement, with special ribbed adamantine tiles round the promenades of the swimming baths next the stone kerb to prevent slipping. A large well, 8 feet diameter, has already been sunk on the site to a depth of 120 feet, and, when completed, will reach a depth of 160 feet below the ground level, and a bore-hole 12 inches in diameter has also been made to a further depth of 465 feet, making a total depth of 625 feet. An ample supply of water has been obtained, equal to about 9,000 gallons per hour, and this will be raised by special deep-well pumping machinery, and discharged

into a cold-water reserve tank, capable of holding from 50,000 to 60,000 gallons of water. The estimated cost (including the well) is 25,000*l.*, and the committee recommend that they be authorised to invite tenders and to proceed with the work.

PYECOMBE CHURCH, SUSSEX.

THE rector and churchwardens of Pyecombe are now engaged in an effort to obtain funds for the restoration of the parish church. The building is of great antiquity, and is interesting from an archaeological point of view, as, in addition to the Norman work, there are some traces of Saxon material to be found in it. A remarkable feature is the triple arch (of more than one architectural style) dividing the nave from the chancel, and the leaden font, which is believed to date from the eleventh century, is also of much interest. Very few leaden fonts are to be found in the kingdom—about twenty, it is believed, three of which are in Sussex churches. The church is in a very exposed position, situated as it is on a hill, so that it has to bear the brunt of "all the winds that blow"—in fact, most of the dwellings in this picturesque parish in the Southdowns are much more sheltered than is the grand old church which has outlived so many generations. And then there is the hand of time, that at once beneficent and destroying power, and so the structure has fallen into bad repair, while the tremendous gale which swept over Sussex on Ash Wednesday of this year brought such serious injury to the church that restoration has become absolutely necessary. It is to be hoped that the work will be begun before another winter sets in, but of course heavy expense will have to be incurred. Among the works which it is necessary to take in hand are the re-roofing of a portion of the tower and nave, restoring the belfry, putting in new windows, with fresh iron, lead, glass and stone-work, painting a portion of the walls with petrifying damp-proof solution, improving the heating apparatus, improving the seating, altering and increasing the accommodation for the school children, putting new guttering and stack pipes to the roof and a new brick drain round the exterior of the building, &c. It is estimated that a sum of 500*l.* will be required for adequately effecting these purposes, a sum which it would be impossible to raise within the parish, which is a purely agricultural one, with a population of 350 and no resident landowners or gentry.

147 STRAND, LONDON, W.C.

THE GREAT CENTRAL RAILWAY EXTENSION.

THE extension to London of the railway system which until recently was known as the Manchester, Sheffield & Lincolnshire Railway, but will henceforth bear the name of the Great Central Railway, is making progress towards completion. The London section of the line, which has changed the aspect of St. John's Wood and swept away insanitary areas in the region of Lisson Grove, Marylebone, is being pushed on rapidly. Both the passenger and goods terminal stations are in the parish of Marylebone, the former of which, faced in Marylebone Road by the Grand Central Hotel, will have two long arrival and departure platforms. Down the centre of each is to be a cab-rank. Instead of one large glass and iron span covering the terminus, the roof will be built in short arches. The Grand Central Hotel, now in course of completion, will have a frontage of 200 feet and a depth of 315 feet. The hotel is to have a courtyard after the continental fashion. The terminal buildings also include a goods warehouse and coal dépôt. Having regard to the district now served by the railway and its possession of the port of Grimsby, a huge traffic in coal and fish is confidently anticipated. The goods warehouse will be five storeys high, 380 feet long and 270 feet wide. The coal dépôt will occupy a site formerly covered with slum property, and, in accordance with statutory obligations, the Company have erected blocks of industrial dwellings, presumably for the accommodation of the population displaced. As in most such cases, however, the tenants of the new buildings are not those of the old, but a superior class.

ROCK-CUT TOMBS, TEMPLES, AND HABITATIONS.*

(Concluded from last week.)

THE monasteries, which exceed the temples in number, seem generally to have been square caves supported by pillars of the natural rock left in their places and surrounded by a number of small sleeping places or cells. The most wonderful excavations are those at Ellora, near Aurangabad. These are a series of hypogea or caves sunk in the solid rock, extending a distance of three or four miles. Canina has given plans and views of the interiors of six of them. Those called Parasova Rama and Diannata are simply halls supported on massive piers with level architraves. The piers are richly carved with

figures and friezes and have a sort of cushion capitals and square abaci, and stand round forming a kind of atrium. That called Indra has a court open to the sky, in which is a shrine or small temple. In the solid rock are two halls similar to those before described, a larger and a smaller. The piers of the Tin Tal are quite plain.

In the Viswakarma is a quadrangle open to the sky and surrounded by pillars. This leads into an atrium with three aisles and an apse, and exactly like a basilican church. The most magnificent of the Ellora caves, and indeed of the native Hindoo works, are the chambers and halls called the Kylos or Kailasa. These are sunk into the rock, and occupy a space of 270 feet deep (from front or rear) and 150 feet wide. The roofs are solid rock supported by pillars, or resting on the walls or on the divisions of the assemblage of chambers. There is a porch, on each side of which there are two columns. This conducts into a hall supported on sixteen columns and leading into a sort of adytum. Round this is a passage space and five chambers. The whole forms a temple with its usual appendages, just such a one as would be built on the ground, and round this a wide open space, with a colonnade or cloister encircling the whole. A part is open to the sky for the sake of light and air, but the work is entirely cut out of the solid rock. The date of its construction is about 1,000 of our era. Another celebrated excavated temple is the one at Elephanta, near Bombay. It is 130 feet long, 110 feet wide and 14½ feet high. The ceiling is flat and is supported by four rows of short baluster-shaped columns about 9 feet high. A square pedestal forms about one-third the height of the column. A great portion of the wall is covered with colossal human figures forty or fifty in number, in high relief, and distinguished by a variety of symbols, probably representing the attributes of the deities that were worshipped, or the action of the heroes whom they represented. At the end of the cavern there is a dark recess about 20 feet square entered by four doors each flanked by gigantic figures. Mr. Robertson, whom Mr. Gwilt quotes, says:—

"These stupendous works are of such high antiquity that, as the natives cannot, either from history or tradition, give any information concerning the time, in which they were executed, they universally ascribe the formation of them to the power of supreme beings. From the extent and grandeur of the subterranean mansions, which intelligent travellers compare to the most celebrated monuments of human power and art in any part of the earth, it is manifest that they could not have been formed in that stage of social life where men continue divided

into small tribes unaccustomed to the efforts of persevering industry."

Excavations similar to those at Elephanta are found at Canarah in the island of Salsette, near Bombay. In these there are four storeys of galleries leading in all to 300 apartments. The front is formed by cutting away one side of the rock. The principal temple 84 feet long and 40 feet broad is entered by a portico of columns. The roof is of the form of a vault, 40 feet from the floor to its crown, and has the appearance of being supported by thirty pillars octagonal in plan, whose capitals and bases are formed of elephants, tigers and horses. The wall contains cavities for lamps and is covered with sculptures of human figures of both sexes, elephants, horses and lions. An altar 27 feet high and 20 feet in diameter stands at the further end and over it is a dome shaped out of the rock. Though the sculptures in these caves are low in rank when compared with the works of Greek or Etruscan artists, yet they are certainly in a style superior to the work of the Egyptians, and we infer from them a favourable opinion of the arts in India at the period of their formation. We will bring this part of our subject to a close and proceed at once to the consideration of the last part, "Rock-cut Habitations."

Probably the most extensive system of rock-cutting for tombs, temples and habitations combined is that found in Arabia Petra, known in history as the city of Edom or Idumea. This city or what remains of it is located in a narrow valley among the mountains of Arabia Petra. The entrance to this valley is through a ravine from the east. It is, says a recent visitor—

"About a mile and a half in length, and winds continually, taking unexpected turns, as if it were the most flexible of meandering rivers instead of being a chasm in a mighty mountain wall. About 50 feet from the eastern entrance to the defile a picturesque arch is thrown across from one precipice to the other at a great height. Immediately beneath the spring of the arch on each side niches enriched with pilasters, evidently intended for statues, are sculptured in the face of the rock. At this point the cliffs are from 80 to 100 feet in height and the chasm is not more than 12 feet wide. It is one of the narrowest parts of the chasm. The bottom of the ravine watered by the brook from Ain Musa in the winter descends rapidly on its way towards the west, and the sides become proportionally higher, varying from 100 to 250 feet or more in height. They are everywhere perpendicular and the effect of the narrow strip of blue sky seen from the

gloomy depths below is very striking. Suddenly a flood of light streams across the ravine from a deep gash in the cliffs on the north side and on the south side simultaneously, and beyond it the beautiful rose-coloured temple, Khugneh-Faron, appears carved in the cliff of the southern chasm facing the east. From this point the defile pierced on each side with tombs and caves innumerable turns towards the north-east until it opens into a little glade overgrown with oleanders and tamarisk bushes, a favourite haunt of the present inhabitants of Petra and close to some tombs which serve as convenient dwelling-places. The rock-hewn amphitheatre is just below towards the north. Beyond it the cliffs, still honeycombed with caves and tombs, once more approach each other till a little further to the north they open into the Valley of Petra. The bed of the winter torrent pursues its way and, as it crosses the valley, winds among the ruins of the city of Petra, then enters a defile in the western hills."

The city of Petra or Idumea is of ancient origin, and dates back to the days of the Pharaohs, at the time of the Israelitish exodus from Egypt, when Moses with his whole army came to the borders of Idumea. He sent ambassadors to the king of the Idumeans and desired him to give him a passage through his country, and agreed to send him what hostages he should desire to secure him from injury. The king refused permission, and Moses withdrew his forces and travelled around Idumea through the wilderness. There is no question but what Petra, hemmed in as it was by impassable cliffs on all sides except by its eastern and western entrances, was an important commercial centre. Its limited area and the precipitous cliffs by which it was surrounded would to a great extent prevent it from becoming at any period of its history a very populous city. Its circumscribed area, would have a tendency to compel its inhabitants to resort to the expedient of providing themselves with places of abode in the cliffs of the rocks. Professor Palmer, who visited the locality recently and who contributes several interesting articles in "Picturesque Palestine," thus describes the ancient city. He says:—

"The effect on entering the city is most imposing, the chief monuments being hewn into the solid rock, and the most elaborate façades, pediments and pilasters, and all strictly monolithic. The valley was no doubt occupied in the earliest times by the cave-dwelling tribes who are spoken of in the Bible as Horites, and their dwellings have been enlarged and ornamented by the later inhabitants, and used for, houses, temples and tombs. In some of the caves, notably at the smaller and less known rock-cut towns which still exist in

the neighbourhood, though unknown to travellers, the walls and ceilings are decorated with elaborate and graceful patterns painted in distemper, as bright and fresh as though they had been but lately finished. One ceiling at El Barid, which was discovered by the late Mr. Drake and myself, is painted with festoons of grape vines and convolvuli, with Cupids playing among the branches. The design is evidently Roman, and is extremely well executed."

The ancient architecture of Petra was, under Roman civilisation, so changed and modified that scarcely a vestige of it can now be traced, and its present architecture belongs to the debased Roman style which prevailed in the third and fourth centuries of the Christian era, when the severe simplicity of the Classical period had given way to florid decoration, and harmony of design was sacrificed to striking effect. Professor Palmer in describing the valley says:—

"The first thing which strikes the spectator is the magnificent colour of the rocks. The stone where the surface is old and weathered is of a deep chocolate hue, but where it has been more recently cut or excavated it assumes a bright red, or yellow tints relieved here and there by white, the general effect being that of gorgeous watered silk. . . . At a point in the valley where the ravine takes a sharp turn we come upon one of the most remarkable monuments in Petra, called Pharaoh's Treasury, excavated in the solid rock, and surpassing all the other tombs and temples in beauty of colour and execution. The façade is of a deep but delicate rose colour, which shines out in strong relief against the deep reddish brown of the uncut rock around it and the bright green of the oleanders and other shrubs beneath it. The façade consists of a portico originally of six columns, but one of them has been broken away. The four middle pillars support a pediment. On the apex of this is an ornament which has been variously described, but which on more careful examination proves to be a lyre. Above the whole is a very curious piece of ornamentation. A second pediment the width of the whole façade is supported by two pilasters at each end. The pediment has been cut through on each side of the centre, and the block so left has been fashioned into a cylindrical ornament surmounted by an urn. The cylinder and recess have been furnished with pilasters and dressed to correspond with the front portions. This pediment which has thus been divided into three parts presents nine faces of rock, each having a pilaster on either side, and on these are sculptured female figures with graceful flowing drapery."

It is probable that these nine figures represented the nine muses, and that this beautiful excavation was designed as a museum. Time will not permit me to give a further description of this wonderful city of the rocks. You will pardon me if I suggest that much of the beauty of that enchanting spot comes from the tone and colour of its rocky walls. This of itself should be an important lesson to architects and builders in the designing and erecting of public buildings.

PATENTS.

This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.

APPLICATIONS FOR PATENTS.

18094. Robert Adams, for "Improvements in means and appliances for opening, closing, regulating and fastening at any required angle swing windows, doors, ventilating fanlights and analogous articles."

18150. Hugo Reimer and Harry Tossell, for "Round or flat rod chimney, with attachable springs and rings."

18151. Cyeil Timm, for "Improvements in machines for making bricks."

18248. Philip Middleton Justice, for "Improvements in and connected with apparatus for opening and closing bulkhead and other doors, hatches, parts, valves, gates and the like."

18298. John Williams, for "Wind defier chimney-cowl."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.,

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

CONTRACTS OPEN.

ABERDARE.—Aug. 24.—For erection of a detached villa in Abernant Road. Messrs. Watkins & Davies, architects, 4 Canon Street, Aberdare.

BELFAST.—Aug. 28.—For erection of a house on the Antrim Road. Mr. James A. Hanna, architect, 102 Donegall Street, Belfast.

BENSHAM.—For plastering thirteen houses near station. Mr. Morris, builder, Millicent Terrace, Gateshead.

BEXLEY.—Aug. 24.—For repair of old church tower and spire, Bexley Heath. Mr. J. Russell Willmore, hon. secretary, Bexley Heath.

BLACKBURN.—Aug. 28.—For extension and alteration of the buildings at the electricity works, Jubilee Street. Mr. E. M. Lacey, engineer, 10 Delahay Street, Westminster.

BRIDGEND.—Aug. 25.—For erection of a temporary wood and iron block to accommodate 100 patients at the Parc Gwyllt Asylum. Messrs. Giles, Gough & Trollope, architects, 28 Craven Street, Charing Cross, London.

BRIDLINGTON.—Sept. 3.—For erection of board-room offices adjoining the workhouse. Mr. Samuel Dyer, architect, &c., Bridlington Quay.

BRISTOL.—Aug. 31.—For erection of ward accommodation for 150 female patients, a nurses' annexe, isolation hospital, and a dining and recreation hall and offices, &c., at the Lunatic Asylum, Fishponds. Town Clerk, Council House, Bristol.

BRIXHAM.—Aug. 24.—For enlargement of the fish market by the construction of an embankment wall about 230 feet in length, and extending about 26 feet from the southern boundary of the market. Mr. Wm. B. Spark, clerk, Brixham.

BURNLEY.—Aug. 26.—For additions to chancel and new vestries, &c., at St. Andrew's Church. Messrs. Austin & Paley, architects, Lancaster.

BUXTON.—For erection of a retaining wall to the village green, Fairfield. Messrs. Garlick & Flint, architects, Buxton.

CARDIFF.—Aug. 28.—For erection of a truant industrial school near Dinas Powis. Mr. W. H. Dashwood Caple, 1 St. John Square, Cardiff.

CHELTHENHAM.—Aug. 28.—For erection of school buildings opposite the Lyefield Schools, Charlton Kings, and for alterations to the present buildings. Mr. James Villar, architect, 1 Cambray, Cheltenham.

COLCHESTER.—For addition to The Cannons, Layer Road. Mr. Chas. E. Butcher, architect, 3 Queen Street, Colchester.

COLCHESTER.—For erection of a house in Beaconsfield Road. Mr. Chas. E. Butcher, architect, 3 Queen Street, Colchester.

COLNE.—Aug. 26.—For construction of refuse destructor, building engine-house, mess-room, &c., and offices of the proposed health dépôt, off Burnley Road. Mr. T. H. Bartley, borough surveyor, Town Hall.

CORK.—Aug. 26.—For erection of temporary buildings at Cork District Lunatic Asylum. Mr. W. H. Hill, 28 South Mall, Cork.

DERBY.—Aug. 23.—For the brickwork for six refuse-destructor cells, for the Corporation. Mr. R. J. Harrison, borough engineer, Babington Lane, Derby.

UNEQUALLED FOR ALL DECORATIVE PURPOSES.

Aspinall's

ENAMEL

For Inside and Outside Work.

READY FOR USE.

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

ASPINALL'S ENAMEL can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special "DECORATOR'S" ENAMEL.

ASPINALL'S ENAMEL. LTD., NEW CROSS, LONDON, S.E.

TRADE NOTES.

THE new sanatorium, Hastings, is being warmed and ventilated by means of Shorland's patent Manchester stoves, grates and patent exhaust roof ventilators. The Linslade Rural District Hospital, Leighton Buzzard, is also being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special inlet panels.

THE new novel, "The Spirit of the Day," recently published (Beeton & Co., 2s.), is running into a second edition. The press criticisms have been exceedingly favourable, and as it is the first work of any serious import done by the author, Mr. Mulvy Ouseley, he is to be congratulated. H.R.H. the Princess of Wales and the Duke of York have honoured him by accepting a copy of the work.

IN the peristyle of a house at Pompeii recently excavated two fine wall-paintings have been found, probably transferred there from some other building. One of these represents a poetess reading to a female musician; the other a young girl leaning against a pillar, and conversing with a girl seated and wrapped in a large mantle.

ELECTRIC NOTES.

THE electricity committee of the Glasgow Corporation have agreed, in view of the city's requirements, to purchase ground near Eglinton Toll, in the southern district, and a portion of land near Phoenix Park, in the north-western district, as sites for new producing stations. It is believed that these sites will meet the necessities of the city for at least a quarter of a century.

At a meeting of the lighting committee of Aberdeen Town Council Mr. Lewis Anderson, the lighting inspector, submitted three schemes for the improved lighting of Union Street. Decision was deferred until information has been obtained as to the difference in the cost of lighting by gas and by electricity. The feeling of the committee was in favour of electric lamps along the centre of the street. It was decided to erect four overhead electric lamps in Market Street.

At a meeting of the Harrogate Town Council, the electric committee made application to borrow the sum of 16,500*l.* for the purpose of extending the electric-lighting plant and works, situate on the Corporation Farm, just outside the borough boundary. Councillor T. H. Thwaites, chairman of the committee, stated that the proposed extension was essential owing to the increased demand that had been made for the electric light. The Corporation have decided to apply to the Local Government Board for sanction to borrow the sum named. The electric-lighting works have already cost 27,000*l.* The sum of 3,000*l.* of the proposed loan will be applied for the purpose of further street lighting.

JAMES GRIFFIN, New Bedford, Mass., U.S.A., formerly of Bath, an employé of the Fall River Mass. Electric Lighting Company, was electrocuted on Friday, July 30, while engaged in stencilling the arms of a pole. His body came in contact with the ends of two tire wires which held cables to the poles, and he received 2,000 volts, alternating current, killing him

instantly. He fell backwards to the ground, 21 feet, and his skull was crushed and both arms were badly burned. Griffin was about forty years of age and leaves several children. He was considered a careful and experienced man.

BUILDING AND BUILDERS.

THE watching committee of Aberdeen Town Council have approved the plans for the new fire brigade station in King Street. The buildings are estimated to cost 11,896*l.*

Two men employed in erecting new chemical works at Baxenden, near Accrington, were killed and three others severely injured by falling off a scaffold. They were working at the first storey, when the scaffold gave way, and they were hurled to the basement.

WHILE a slater's labourer named Philip Fernie, thirty years of age, and residing at Commercial Road, Glasgow, was working on the roof of a building, 36 feet high, in William Street, Glasgow, he fell to the ground. The only injury he sustained, however, was a few bruises.

THE public health committee have recommended for approval by the Chester Town Council the tender of Mr. Freeman, to erect the same for 14,400*l.* The Local Government Board have sanctioned the expenditure. The site of the proposed hospital is on the Sealand Road, about a mile from the city, and it is intended that the works shall be commenced at once.

THE church of All Saints, Thwing, near Hunmanby, is to be restored. The church dates back to the twelfth century, and contains Norman work. It is proposed to preserve all its ancient features, but the pews will be replaced by open seats. The fine old font, which had been removed from the church and was lying in a garden in another parish, has been repaired and restored. An estimate of partial restoration is 750*l.*, and of entire restoration 1,000*l.*

SCAFFOLDING has been erected round All Saints Church at the East Street corner of the High Street, Southampton, and workmen are engaged in knocking off the old cement which composed the outside of the sacred edifice. The work that is to be done is to re-cement the exterior of the building, together with certain other repairs and renovations to both exterior and interior. The work is being carried out by Messrs. Jenkins & Sons, Portland Street, Southampton, and Bournemouth.

VARIETIES.

THE new tower of Flamborough parish church was formally dedicated by the Archbishop of York on the 11th inst.

MR. YOUNG, Lord Penrhyn's manager, was able on Wednesday last to accept the terms which were offered by the men for his approval. The conditions will be made known to-morrow (Saturday) evening.

THE West Lancashire Rural District Council have recommended the Formby parochial committee to take into consideration the question of forming a separate drainage district for Formby, so that the expenses of such a work may be borne by the township, and not by the Council's district.

THE plans of Messrs. Stevenson & Burstall, of London, for the reconstruction of the Douglas sewerage system, at a cost approaching 50,000*l.*, have been approved. The tender of the Stanton Ironworks Company, Limited, Nottingham, for the supply of iron pipes in connection with the scheme, for 3,481*l.* 11*s.* 3*d.*, was accepted.

IN the course of a severe thunderstorm recently experienced in the Vale of Leven the lightning struck an iron gaspipe in Renton parish church, and running along, it reached and melted the lead pipe in one of the back lobbies. The gas igniting, set fire to the flooring. The church officer, John Graham, was fortunately in another part of the building, and, alarmed by the smell of gas, soon found out the cause. A joiner was got, and tearing up the flooring, had the smouldering wood extinguished.

AT the quarterly and special meeting of the Leeds County Council the scheme for the erection of a wholesale dead meat market and abattoir on a portion of the market estate bounded by York Street, Harper Street and Sykes Place, at an estimated cost of 24,000*l.*, was adopted, and it was resolved to offer premiums for the preparation of plans and estimates.

AN exhibition will be opened at the People's Palace in October next illustrative of trade in all its branches and of inventions brought to light during the Queen's reign. The adjudicators in the various sections will be appointed from the largest and most important firms in the various trades competing. Medals specially designed will be awarded to manufacturers and individual artisan exhibitors.

THE annual demonstration of the National Association of Plasterers and Labourers (Manchester branch) was held on the

14th inst. at the New Brighton Tower Grounds. The party arrived at the Central Station by special train about ten o'clock, and headed by two bands and banners setting forth their claims and advantages, perambulated the principal streets of the city. They were under the superintendence of the general secretary of London, Mr. Dellei, and Mr. M'Laren, secretary of the Manchester branch.

THE new Theatre Royal, which is being erected in Rolfe Street, Smethwick, will be opened on September 20. The theatre is constructed on the most modern lines, and will be capable of accommodating 4,000 persons. The stage is the largest in the district, being 75 feet wide. The building is to be surmounted by three figures symbolic of art, those at the end being 8 feet in height and the centre one 14 feet. The theatre will be lighted with electricity. The builders are Messrs. John Harley & Son, of Smethwick.

AT Messrs. Cordingley & Co.'s forthcoming exhibition at the Agricultural Hall, Islington, which opens on Monday next, there will be, in addition to the largest amount of laundry machinery ever seen under one roof, the finest show of motor cars ever held. There will be seen specimens of steam, gas, petroleum and electrically-driven cars and vans; and that the motor car industry is not dead will be amply proved by some of the very handsome vehicles exhibited. We may mention that specimens of electrically-propelled cabs will be shown for the first time on exhibition, although Mr. Cordingley, the promoter of the exhibition, has had one in use with most successful results for the last fortnight.

THE pended tower formerly connecting the Abbey of Dunfermline with the Palace has been converted into a museum, and was formally opened by Mr. Andrew Carnegie on the 6th inst. The tower, which is a massive oblong building situated at the south-west corner of the abbey grounds and crossing the roadway, was until recently used as a sexton's toolhouse, but through the generosity of Mr. Carnegie it has been transformed into a home for antiquities connected with Dunfermline and neighbourhood. The work of renovating the building has been carried out under the direction of Her Majesty's Office of Works, the plans being prepared by Mr. Hawks, who also undertook the superintendence of the tradesmen. The alterations which it was necessary to make have been of such a character as to retain the whole building in harmony with its surroundings. There are in all four rooms

of different sizes and shapes. The windows have been filled in with cathedral glass, and in the principal apartment the Scottish standard and the Dunfermline burgh arms appear in the eastern and western lights respectively, while Mr. Carnegie's monogram is shown in another.

AUGILL CASTLE, near Brough, Westmoreland, and about five miles from Kirkby Stephen, has been offered for sale by auction at Kirkby Stephen by Messrs. Thornborrow & Co., of Penrith. The residence, which was offered with $8\frac{1}{2}$ acres of meadow land, was the property of the trustee of the late Mr. J. H. Jackson, of Culgarth. The house has the reputation of being haunted, and has not been occupied during the last fifteen years. Last winter it was visited by large crowds, who are said to have been awed by mysterious lights flitting about the premises. The property was purchased by Mr. Dyson, of Rylstone House, Skipton, for 650/. The castle, which is said to have cost 14,000/. to build, was sold some years ago for over 2,000/. Since concluding the transaction, Mr. Dyson has received numerous offers of sums ranging from £500 to £5,000 profit on the purchase; these, however, he has declined.

THE borough surveyor of Blackpool has submitted to the members of the Council his scheme for widening the Promenade—an improvement that has now been talked of for some years. He shows that the present Promenade varies in width from 24 feet to 70 feet, and the footpath from 5 feet to 17 feet. The scheme, which will probably be put before Parliament for sanction, provides for a footpath 10 feet wide on the east side next the houses, a carriage-way 55 feet, an island footpath 10 feet wide, a raised track for a double line of trams the whole length of the Promenade 20 feet 9 inches wide, and then the Promenade footpath, with a uniform width of 42 feet, faced at the side by a sloping bulking of 15-inch granite setts. The sea wall will be exactly like that on the North Shore works, and will run on the same level till it meets the new Promenade opposite the south end of the Tower, where it will join the upper one. The concrete of which it will be constructed will be 7 feet thick, and faced above the granite hulking with concrete blocks and coping. The estimates state that the cost of the section from the south end to the Manchester Hotel will be 117,896/.; the second section, from the Manchester Hotel to the Royal Hotel, 98,661/.; and the third section, as far as the North Shore Promenade, 132,424/., a total cost of a little under 350,000/.. The scheme has already been considered by the Council, and awaits final decision.

A NEW bonded warehouse nine storeys in height is about to be erected at Bonnington, Leith. Messrs. Pattisons have recently acquired an old sugar refinery for the purpose of extending their storage accommodation. The old buildings are being partly demolished, and partly converted into bonded stores. In addition to the existing buildings, the firm are erecting a new bonded warehouse, which, it is believed, will be the largest in the kingdom. The new building stands on the banks of the Water of Leith, and has a railway siding running into it from the Leith branch of the North British Railway. The new building is 190 feet long one way by 180 feet the other. The height from the foundations is close upon 100 feet. The floorage area is $6\frac{3}{4}$ acres. It is entirely built of brick, and there will be about one million and a half of bricks used in its construction. The interior, having to bear great weights, is entirely constructed with steel standards and steel beams, the old cast-iron construction of bonded warehouses being abandoned. By this means greater strength and greater economy is secured. There are upwards of 2 miles of steel standards in the new warehouse, and $5\frac{1}{2}$ miles of steel beams. It is calculated that when the building is filled with whiskey it will accommodate over 22,000 casks. There are three mechanical lifts in the new building for taking in and discharging the casks, and these can be raised direct from the carts and from the railway trucks without intermediate handling. The lowest floor, which is to be used as a duty paid and bottling department, will be entirely fireproof. The architects for the new building are Messrs. George Beattie & Son, 136 George Street, Edinburgh.

THE River Weaver Trustees have just commenced an undertaking which is intended, by an expenditure of 35,000/., to greatly improve the waterway. The sum has been borrowed, the Cheshire County Council being the guarantors. The work includes the erection of two swing-bridges worked by electricity, the making of new roads and the removal of obstructive locks. One swing-bridge will replace the fixed bridge at Northwich on the high road between Manchester and Chester. This structure is constantly sinking, and though it has been raised as high as the gradients of the road permit, salt craft returning light to Winsford have been unable to pass beneath or have only got through with the utmost difficulty. In order that road traffic shall not be unduly interrupted an alternative swing-bridge and road are being made 400 or 500 yards distant. As the land in the neighbourhood of both is subject to subsidence the weight of the bridges will rest on pontoons,

EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,
LONDON. N.W.

which will not be affected by any difference in the levels of the river in times of flood or drought. The town's gas and water will be carried under the river by a duplicate set of pipes placed in syphons. By the removal of the Newbridge Locks, two miles below Winsford, the water level will be raised, thus enabling larger craft to navigate the river and to carry greater cargoes to Liverpool and Manchester. The order for the construction of the bridges, apart from electrical connections, &c. has been placed in the hands of Messrs. A. Handyside & Co., Limited, of Derby, the contract being 16,687*l.* Messrs. Beckett, of Hartford, are making roads at a cost of 3,018*l.*, while the remainder of the work will be carried out by the trustees' own employés.

THE new station at Mauchline, on the Glasgow and South-Western Railway, with increased waiting-room accommodation, is now completed, and has just been opened. The new premises, situated a little to the north of the old buildings, are of the most modern style and in keeping with the increased traffic. Built of Ballochmyle redstone and rough-cast, they consist of a large booking-hall, agent's room, parcels office and booking office, ladies' waiting-room, gentlemen's first-class waiting-room and dressing-room, and a general waiting-room, all tastefully furnished and fitted up. On the opposite side of the main line, where formerly there was no waiting-room accommodation for the convenience of Glasgow and Ayr passengers, there are now two commodious waiting-rooms.

THE report of the architect instructed to ascertain the extent of the subsidence of Dane Bridge parish church, Northwich, has been received, and sets forth that there is "a very serious settlement in the brickwork of the vaulting below the sanctuary, causing the abutment of the arch carrying that portion of the sanctuary floor to give way. In other parts there are settlements in the foundation walls which make the continued safety of the sanctuary very doubtful. Owing to subsidence the font has a bearing on only two of its four foundation walls, and these, with settlement, are very critical. No dependence can be placed upon it." The report concludes:—"I am of opinion that the only portion of the church which is at present safe—apart from subsidence—to use for public worship is the nave between the chancel arch and the cross aisle in line with the entrance porches westward. I consider that the altar should be moved west of the chancel arch, and all the remaining provision for the services should be arranged within these limits until accommodation can be provided by the erection of a framed building."

NEW CATALOGUE.

WE have just received from Messrs. Croggon & Co., of 16 Upper Thames Street, a copy of their new catalogue, or the section of it relating to electric apparatus, comprising electric bells and fittings, telephones and electric-light supplies. It contains numerous illustrations of bells, batteries, pulls, pushes, switches, contacts, fire alarms and accessories of every description. In the lighting section will be found many very pleasing designs in brackets and other fittings, and all prices are plainly given.

A HANDY CONTINENTAL GUIDE.

THOSE of our readers who propose to make a holiday trip to the Continent, whether they intend their stay to be of limited or lengthened duration, should in any case be careful to provide themselves with the excellent and handy "Tourist Guide to the Continent," by Percy Lindley, which is being issued by the Great Eastern Railway Company. Although contained in only some 150 pages, the information is succinctly given, and embraces Holland, Germany, Belgium and Switzerland. Among its excellent features are a series of continental maps, a chapter upon cycling routes in Holland, Belgium and Germany, and a chapter, "Dull, Useful Information," giving particulars as to the cost of continental travel. The price of this useful little volume, which is profusely illustrated and well printed on good paper, is only 6*d.*

THE IRISH CHANNEL TUNNEL.

A REPORT has been presented to the Belfast Chamber of Commerce by the deputation that interviewed the President of the Board of Trade on the subject of the proposed tunnel between the South-West of Scotland and the North-East of Ireland. The deputation report that although they were met by the President of the Board of Trade with every courtesy, their reception was distinctly unfavourable. Mr. Ritchie, they say, expressed the opinion that the construction of such a tunnel was practically impossible, and that if not impossible, the expense might be far in excess of any estimate fixed by several eminent engineers who had been consulted by the deputation; further, that to undertake preliminary inquiries would, on the part of the Government, be a new departure; and, lastly, that those who might be injured by the possible diversion of traffic would raise an opposition with which the

Government would have to reckon. The deputation assured the Council that they adhered strictly to the instructions they had received, and did not suggest directly or indirectly that the Government should commit themselves to the construction or financing of the tunnel at all. The deputation referred to the strong engineering evidence before them in order to justify and call for inquiry and examination by trial borings and soundings, and the preliminary inquiry which they considered absolutely essential to the formation of anything like a sound opinion on the subject. The deputation suggest that a small committee of the Council, along with the President and the two Vice-presidents, should be appointed to continue in charge of the matter, and also that they be authorised to act with the London committee to further the project. The report was adopted.

IRON AND STEEL CONSTRUCTIONS.

THE following report has been issued by General W. Sooy Smith, United States Government supervising architect for public constructions, on the best means of rendering iron and steel constructions perfectly proof against corrosion and the effects of heat:—

"Rust, under favourable circumstances, will eat to 1 inch depth in iron in eighty years. This means that the steel buildings in Chicago, as they are built to-day, may not survive more than thirty years. To make them perfectly safe corrosion of the steel must be prevented. This is a thing to be accomplished by the use of the new fireproofing material, but I will first consider the effect of fire:—

"Owing to the combustible material in buildings, the present fireproofing as applied to modern buildings will be heated to redness very quickly. Then along come the fire-engines and throw a stream of cold water upon the heated parts of the building. To be good, the fireproofing must be able to resist the combined action of red heat and cold water.

"I have tested nearly all the best fireproofing employed in this city, but not a single one have I found that can be heated to redness and plunged into cold water without cracking. Some of it literally burns up. Some will stand red heat without cracking, but none will withstand the combined action of heat and water as described. Another trouble lies in the fact that nearly all the so-called fireproofing material is a good conductor of heat, a thing which makes it valueless as fireproofing, permitting, as it does, the passage of heat to the steel.

"The rigidity of steel, without being heated to redness, decreases considerably when the temperature rises above 400 deg. Fahrenheit. In this city the fireproofing in any building containing a moderate amount of combustible material would, should the structure take fire, be heated beyond that degree, and even to redness. Then the columns would yield and the building come down with a crash.

"The danger is increased owing to the fact that, with a moderate rise of temperature in a steel building, the beams and girders of the floor systems would expand unequally as the heat varies. These unequal expansions would throw the columns out of the vertical and into a buckling position.

"Instances of this are shown in the fire which destroyed the Manhattan Life Insurance Company's building in New York. The structure was destroyed, although the fire which caused the disaster was in a building 50 feet away. The building of the Chicago Athletic Association was on the point of falling from the same cause, although the fire did not last half an hour. In this case the columns of the lower storeys were completely stripped of fireproofing by the action of the heat and water.

"Fireproofing, to be worthy of the name, must resist the combined action of heat and water and be a non-conductor of heat. In trying to find a material that would serve the required purpose I first tried talc, which is a good non-conductor and very refractory. Soapstone is an impure talc. By mixing this in a pulverised condition with hydraulic cement and other substances I succeeded in making a good fireproofing material.

"While conducting these experiments I heard of a material in the great asbestos mine near Montreal, Canada. There is found in that quarry serpentine rock carrying a large percentage of asbestos. This rock, pulverised and mixed with good cementing materials, makes by far the most perfect fireproofing yet discovered.

"Asbestic, as the new material is called, is invaluable for use in a general way as fireproof plasterings in all sorts of buildings. It will prove especially so in its application as fireproofing for covering the steel parts of buildings.

"It may be heated to 1,100 deg. Fahr. (red heat) without harming its durability. Nails may be driven into it and it will not crack. When the nail is removed nothing but a small hole remains, which may be readily filled with putty or any other substance in order to restore the finish of the wall. Struck with a hammer, there is no breakage, only the indentations showing. Then, again, the material is elastic. If the building

settles or sinks it stretches, and the plastering is not marred. Another point is that it will take decoration equal to canvas without danger of the picture being destroyed should the walls settle.

"This material is a thoroughly fireproof plastering. On this I will stake my reputation as an engineer. I have experimented for many years, and I know what I assert. Another point of interest is the weight. It is a third less than ordinary plaster covering the same area. Thus it is that the weight of this asbestic plastering will be so much less than the ordinary article that there is a large diminution in the weight borne by the columns in the building. This will allow a considerable saving in steel, more than sufficient to pay the slight excess of its cost over common plastering.—Chicago, July 1897."

Apropos of this, Messrs. Witty & Wyatt, Limited, are showing at their offices, 88 Leadenhall Street, London, E.C., some excellent samples of asbestic plastering on expanded metal, "Jhilmil," &c., which will be found worthy of inspection.

WHITWORTH SCHOLARSHIPS.

THE following candidates were successful in the competition for the Whitworth Scholarships and Exhibitions, 1897:—

Scholarships value 125*l.* a year each (tenable for three years) to George M. Russell, 25, student, Porchester; George M. Brown, 25, engineer, Swallow; William Du B. Duddell, 24, electrical engineer, London; George Wilson, 25, engineer, Sheffield.

Exhibitions value 50*l.* (tenable for one year).—George Service, 21, apprentice engineer, Cambuslang, N.B.; Edgar J. Kipps, 23, engineer, Bootle; Frank Piercy, 25, draughtsman, Newcastle-on-Tyne; Arthur Morley, 20, student, Manchester; A. Marshall Downie, 21, apprentice engineer, Glasgow; John R. Powell, 22, engineering student, Cardiff; Alfred D. Owen, 19, fitter, Plumstead; Charles C. Allen, 20, tool maker, Manchester, and William J. Rouse, 25, draughtsman, Cathcart, N.B. (equal); Arthur E. Holmes, 25, fitter, Southsea; Alfred T. J. Kersey, 21, engine-fitter, Portsmouth; Edward C. Horsley, 23, draughtsman, Newcastle-on-Tyne; John Berry, 19, engineer's apprentice, Bolton; James Turnbull, 23, locomotive engineer, Glasgow; Thomas Taylor, 24, engineer, Dunblane, N.B.; Robert L. Wills, 23, student, Dublin; James Paton, 22, engineer, Govan, N.B.; Henry T. Sisson, 25, draughtsman, Gloucester; Leonard Ward, 24, fitter, Plumstead; Arthur W. Loveridge, 21, engine-fitter apprentice,

Southsea; Timothy A. Thomas, 25, draughtsman, Plymouth; William Bell, 23, draughtsman, Erith; John R. Billington, 24, draughtsman, Horwich; George Powell, 23, fitter, Crewe; Edgar W. Riley, 20, assistant-engineer, R.N., Dublin; John Marshall, 21, engineer student, London.

REPAIRING OR REBUILDING SCOTTISH CHURCHES.

WE lately published some of the evidence given by architects and builders upon the condition of the Shettleston Church, which is under the jurisdiction of the Presbytery of Glasgow. The question to be decided was whether the church could be repaired or whether rebuilding was necessary. The expense in the former case would have to be defrayed by one party, and if the church were rebuilt another party would become responsible. The Presbytery of Glasgow declared the church to be in a ruinous state and ordered rebuilding. The "heritors" appealed, and the case was heard in the Glasgow Sheriff Court during several days. Sheriff Strachan confirmed the judgment of the Presbytery. The following explanation by him of the reasons by which he was guided appears in the *Glasgow Herald*:—

In the course of a long note to his interlocutor, the Sheriff said that the church was built about the year 1751. The parish was then only a *quoad sacra*, and it continued to be so until the year 1847, when it was created into a parish *quoad omnia* (except as regarded poor-law administration), and the church then became a parish church. It was admitted that it was now decayed and dilapidated and unfit for its purpose, and the question he had to determine was whether it was to be repaired or an entirely new church erected in its stead.

He was of opinion when the case first came before him (involving as it did a matter of some public interest and importance) that the facts bearing on the condition of the church and on the expediency of repairing or rebuilding it could be ascertained better by a proof than by a remit to a practical person, seeing that his opinion could not be tested by any cross-examination, and that by accepting it he would be compelled to base his judgment on somewhat narrow and restricted data. He could not, of course, say what the result would have been had he followed the latter course, but he had no hesitation in stating that nothing could be more unsatisfactory than the voluminous evidence that had now been piled up in this case. He had never known a more striking instance of the unreliability of expert evidence. It would be very surprising,

if it were not so common, to see the extent to which men of high character and ability could, when acting as experts, entertain and express the most conflicting and irreconcilable opinions regarding matters with which they must be familiar in their own everyday experience.

Before dealing with the facts of the case one or two questions of a legal character must be determined, and as regarded these he thought it only necessary to refer to the case of *Bertram v. the Presbytery of Lanark* (Carnwath case), July 20, 1864, which was the latest and, in his opinion, the most authoritative decision on the subject.

The first question that arose for decision was this:—Is there any legal standard or criterion for determining whether a church is to be repaired or rebuilt? In regard to this matter it was held in the case referred to that although no definite arithmetical rule could be laid down on the subject, yet it might be considered as settled that if the expense of repairing a church would only be about one-half of the cost of building a new one, in that case a new church, generally speaking, could not be asked for; but, on the other hand, if the repairs would cost three-fourths of the expense of a new church, then a new church might be asked for. If the expense, however, should fall in the large debatable land within these limits the Court would be influenced one way or the other by special circumstances. And, further, it might be held to be settled that the two things to be compared were not the expense of repairing the old church and the cost of building a new one with adequate accommodation, but the expense of repairing the old church and the cost of building a new one with the same accommodation as the old.

The second point to be determined was the meaning to be attached to the word "repairs" when used in connection with this question. Now, he thought it clear that it was not to be understood in the narrow or restricted sense of merely mending, refitting, or restoring to a good or sound state something which had become decayed or been destroyed or injured. It embraced alterations and additions usually falling under the term "reconstruction" where those were necessary for putting the church into a proper and efficient condition. Thus in the case of *Bertram* above referred to, a large portion of the expense taken into account by the Court in determining whether or not the church should be repaired, consisted of the estimated cost of removing the gallery stairs from the inside to the outside of the church.

The third point was this, What is the criterion or standard

by which the sufficiency of the repairs is to be determined? The heritors' contention on this question was that their duty was discharged if they put the church in as good a condition as it was at the time of its erection in 1751. The case, they said, was entirely different from that of a rich city congregation. The members of that congregation were spending their own money, and could do with it what they pleased; while the heritors, being burdened with the cost of a church which the great majority of them did not attend, and in which they had no interest, were bound to do nothing more than provide a building in which the congregation could worship without risk of injury to their health. In fact, they regarded their obligation very much in the same light as the obligation to make provision for the poor, which was considered to be discharged by supplying them with the plainest food and the cheapest clothing. That was, in his opinion, an entirely mistaken view on their part. There were, unquestionably, very great differences of opinion as to the justice or expediency of providing a church for a particular congregation at the expense of the owners of property in the parish; but there could be no doubt that so long as that was the law of the country it must be administered in a fair, reasonable and equitable manner. What the law required on the part of the heritors was that they provide and maintain in the parish "a suitable and comfortable place of worship." There could, of course, be no formal standard by which the sufficiency of these equipments could be tested; that must be left to the Court to determine in each particular case. He did not think that he should go far astray were he to hold that the standard in the present case might be taken to be the condition into which a modern congregation, possessing the requisite means, would desire to put their own church. Referring to the evidence in detail, the Sheriff said that the controversy as to the state of the woodwork which had been carried on so warmly between the parties was by no means edifying or creditable to them. The witnesses on both sides professed to be perfectly familiar with dry rot, and to be constantly meeting with it in the course of their business—some of them even having been obliged to have experience of it in their own houses; and yet when shown a piece of rotten wood the experts on the minister's side emphatically declared that it was affected by dry rot, while those on the heritors' side with no less confidence maintained that it was nothing of the kind—that it was simply ordinary damp rotting. It was very curious that notwithstanding their professed familiarity with it none of

WORKS, WIMBLEDON, S.W.

the witnesses were able to lay down a common rule by which dry rot could be recognised. Viewing it as a mere matter of evidence he had no hesitation in holding that the dry rot theory had not been substantiated. Besides, notwithstanding all the time wasted over this point it was really not of the slightest importance.

The heritors argued that the vestry was no part of the church, and that they were not bound to maintain it. That, he thought, was a mistake on their part. The vestry was a part or adjunct of the church; it was taken over by the heritors when the parish was erected in 1847, and had since been maintained by them, and would require to be so. As to its present condition it was simply scandalous. He had scarcely ever seen a more dilapidated, depressing and uncomfortable-looking place.

The church was at present heated by a Gill's stove—that was a stove built into the back wall and intended to force heated air into the church through an opening in the wall. It was represented by the heritors to be quite sufficient for the purpose, and they proposed no change. This was unreasonable. It would be difficult to imagine anything more primitive than this system of heating or anything more useless for the purpose it was intended to serve. It could only be termed a heating system on the "lucus non lucendo" principle. According to the evidence it did force some heated air into the church, but it did so, to the extent only of a few pews in the vicinity of the opening in the wall, these favoured places being made uncomfortably hot, while all beyond was left out in the cold. At present there was no attempt whatever at ventilation beyond the primitive method of opening the windows. There really appeared to be no drainage of any kind at present in connection with the church, and the rain and surface water had in consequence no doubt found their way into the foundations and done much to produce the extreme dampness with which the church was affected.

Speaking generally, he was of opinion that if the church was to be repaired, all the operations proposed by the minister, with the exception of the damp-course, would require to be carried out. He was not, however, prepared to say that this must be done in the manner and to the extent proposed by him, or that the estimate made up by his skilled witnesses was to be held conclusive as to the cost. According to that estimate the cost would be 2,224*l.*, from which there fell to be deducted 136*l.* 10*s.*, the estimated cost of the damp-course, and 200*l.* as a reasonable allowance for excess or overstatement in the esti-

mate, making the total cost 1,887*l.* 10*s.* For the purposes of this case the estimated cost of building a new church might be taken as given by Mr. Bryden at 2,916*l.* Three-fourths of that sum was 2,187*l.*; so that the cost of repairing was within the limit which, according to Bertram's case, would necessarily involve the erection of a new church. The choice lay between repairing the old church and re-erecting another of an entirely different character, and at an expense which might be four or five times more than the amount with which the cost of the repairs was compared. If the erection of a new church were ordered, it must be a church capable of accommodating two-thirds of the examinable persons in the parish, that was persons not under twelve years of age. And an idea might be formed of what that meant when it was taken into account that the resident population of the parish was over 15,000 persons. He must do the heritors justice to say that he believed it was not against the erection of a church which would cost 300*l.* they were fighting so keenly, it was against the unknown but necessarily large cost of erecting a greatly enlarged church in conformity with modern tastes and ideas. If he were satisfied that by repairing the present church at a cost of 1,887*l.* 10*s.* it would be put into a "suitable and comfortable" state he would willingly order that to be done. But he was unable to satisfy himself that that would be the result. It would be kept in view that were the repairs carried out which he had held to be necessary, the result would be that the entire structure would be taken down with the exception of the front and two side walls. Now it did seem incongruous to pull down a building 150 years old, with the exception of three bare walls, and then proceed to restore it in the same style as before. Would any prudent man act in this way in dealing with his own property? But he was by no means satisfied with the condition of the walls which it was proposed to leave standing.

On the whole matter he had no difficulty in coming to the conclusion that it was inexpedient to repair the church, and that a new edifice must be erected.

LONDON BOARD SCHOOL BUILDINGS.

THE annual report of the works committee of the London School Board gives an abstract of the work done during the year ended March 25, and shows the progress made in the provision of accommodation which has been sanctioned by the

Board and the Education Department. The committee, over which General Moberly, the vice-chairman of the Board, presides, after stating what had been done in connection with 10 sites for new schools and additional land for 46 existing schools with regard to which compulsory powers were obtained in 1895-96, report that in the past year it had been decided to schedule 20 sites for new schools and additional land for enlarging 25 existing schools or playgrounds or for the purpose of carrying out general improvements. In some cases, however, the sites and the land had since been omitted from the schedule. During the year the Board agreed to purchase various interests in sites, at a cost of 116,561*l.* 13*s.*, the surveyors' fees amounting to 659*l.* 19*s.* 6*d.* The large amount spent upon sites for school buildings since the Board came into existence will afford some idea of the extent of the provision which has had to be made for the accommodation of the children. The value of all the sites purchased or agreed to be purchased previous to March last was 3,222,412*l.*, and the costs 430,621*l.* According to a table prepared by the Finance Department, the cost of the sites for 325 schools, the accounts for which had been completed at September 29, 1896, was 6*l.* 11*s.* 10*d.* per child, and the average cost per head of the school buildings was 13*l.* 14*s.* 1*d.*, and of the furniture and fittings 10*s.* 7*d.* Up to Lady Day 1896, the total number of permanent schools which had been erected and opened was 409; and during the year under review 9 additional schools and 15 enlargements were opened. The 9 new schools were erected—1 in Finsbury, 1 in Greenwich, 1 in Hackney, 1 in East Lambeth, 2 in West Lambeth, 1 in Southwark and 2 in Tower Hamlets. The total accommodation provided was for 8,072 children, and the cost of sites, buildings and furniture was set down at 237,875*l.* 12*s.* 6*d.*, or an average cost per head of 29*l.* 9*s.* 4*d.* The enlargements were carried out in Chelsea, Greenwich, Hackney, East Lambeth, West Lambeth, Southwark and Tower Hamlets. They provided additional accommodation for 4,761 children at a cost of 98,787*l.*, or an average cost per head of 20*l.* 14*s.* 11*d.* Loans were authorised by the Education Department in respect of the 9 new schools and sites amounting to 239,527*l.*, and on account of the 15 enlargements and sites amounting to 131,202*l.*

As to future provision of schools, tenders were accepted during the year for erecting nine new schools—one in Chelsea, two in Finsbury, two in Hackney, two in West Lambeth, one in Marylebone and one in Westminster—giving accommodation for 9,968 children, at a cost of 170,936*l.*, or 17*l.* 2*s.* 11*d.*

average cost per head. Tenders were also accepted for eight enlargements—one in Greenwich, one in East Lambeth, one in West Lambeth, two in Southwark and three in Tower Hamlets—to accommodate 2,696 children at a cost of 69,832*l.*, or 25*l.* 4*s.* per head. With regard to the new schools, it should be stated that each would be provided with a hall for each department, which was not counted in the accommodation of the school, and the tenders included the provision of centres for cookery, laundry, manual training, or special instruction, and in eight cases a drawing classroom. As to the enlargements, the variation in cost arose mainly from the fact that in enlarging the buildings the opportunity was taken to improve the existing schools so as to make them thoroughly efficient, and in some cases centres were added. Tenders had also been accepted for providing twelve cookery centres, fourteen laundry centres, eighteen manual training centres, seven schools for special instruction, rooms for upper standards at three existing schools, extending a chemical laboratory, providing covered playgrounds at three schools, carrying out drainage and sanitary works to twenty-nine schools, and for other works. The total amount of the tenders for sanitary work at twenty-four of these schools was 32,398*l.*

In their last report it was stated that the committee were carefully considering the whole question as to the cost of the schools, and that they had appointed a sub-committee to consider the subject. This committee, whose report has already been published in the *Times*, recommended, with the view of reducing the cost, that among other things the Board should revert to the old specification in force in 1885-86 for the next six schools, subject to certain modifications; and the Board had sanctioned the experiment. Among the other works referred to the committee state that the proposed deaf institution at Anerley, for which a tender had been accepted for 38,920*l.*, had been abandoned because the Education Department had declined to approve of the plans. The industrial school for girls at Isleworth would soon be ready for occupation. Homerton Training College had been purchased and would be used for temporary school accommodation and for the provision of various centres. During the year 132 schools had been painted or cleaned inside or out. The system of carrying out repairs to buildings by workmen employed direct by the Board was being continued in 9 of the 18 districts of the clerks of works for repairs, the total number of men so employed being 49. On the subject of rates of wages paid by contractors, the report states that in all building contracts a revised clause

was now inserted providing that where the London scale of wages applied the contractor should pay to the workmen not less than the rate of wages from time to time mutually agreed upon by the Central Association of Master Builders of London and the representatives of the men's unions, the agreed rate of wages at present recognised being set out in the schedule. In other districts where the London scale of wages did not apply the clause provided that the contractor should pay not less than the minimum standard of wages which might for the time be usual.

At Lady Day last the following amount of school accommodation was in course of provision:—Eighteen schools were being erected providing accommodation for 19,013 children, and 9 enlargements giving accommodation for 3,521 children. Thirty-two additional sites for new schools had been or were to be purchased. The schools to be erected on 20 of these sites would provide accommodation for 17,920 children, and in the case of the other 12 the accommodation had not been determined. Ten new sites for schools had been scheduled, and the schools to be erected on 5 of them would give accommodation for 4,185. Twenty-four enlargements had been sanctioned for 8,075 children, and the Education Department had also sanctioned the provision of sites, which would be scheduled next session, in 5 districts.

The report adds that the playgrounds of 226 schools are now open on Saturdays and 47 on Sundays for the use of the children.

ASSOCIATION OF SANITARY INSPECTORS.

A WELL-ATTENDED meeting of the Association of Sanitary Inspectors of Carnarvonshire and adjoining districts was recently held at Colwyn Bay. Dr. Fraser presided, and amongst those also present were Messrs. E. Davies, Conway; J. R. Thomas, Llewellyn; H. J. Hughes, Ogwen; W. H. Worrall, Bangor; G. Roberts, Carnarvon; W. H. Jones, Colwyn Bay; T. B. Farrington, Conway. It was resolved to write to the various local authorities requesting them to allow their inspectors to attend the different meetings held in furtherance of sanitation, and that their expenses as delegates be paid by the respective authorities; also that the next meeting of the Association be held at Portmadoc early in October. Dr. John Evans, Carnarvon, read an able paper on "The Relationship of Germs to Disease."

Mr. Worrall, Penmaenmawr, late secretary of the Northern Association, said great benefit would be obtained by being affiliated with one of the larger associations, and gave notice to move that they consider the matter of affiliating with an English association at the next meeting.

Mr. Stanfield, chief sanitary inspector of Manchester, said that in educating the people in sanitary laws they had the prejudice of "jerry-builders" against them—men who did not care if half the population died if they reaped good profit from jerry-building. They should get local authorities to pay local inspectors well enough to live. It was a pity that some authorities did not pay enough to enable inspectors to live respectably, especially where there were several owners on the Council, who considered an energetic inspector a nuisance. It was therefore necessary for inspectors to form large associations, comprising a large area, and strong combination.

Mr. Gill, Bangor, said if they joined a large association he wished their local association to be distinctive as well.

CONTROL OF THE METROPOLIS.

THE annual report of the chief officer of the Public Control Department of the London County Council, just issued, Mr. Alfred Spencer, embraces a great variety of subjects. Steady progress is reported in the extension of the constant supply of water. Three companies—the East London, the Grand Junction and the Southwark and Vauxhall—are stated to give the benefit of the constant service to the whole of their London areas. Such are the arrangements, but this statement in the report is, of course, to be taken in connection with the fact that occasional interruptions to the supply have happened in some localities. The report further intimates that the Kent Company hope to give a constant supply throughout their London area in the course of the ensuing month, and the Chelsea and West Middlesex Companies by April next, by which date also the New River Company will probably complete a similar service. But the Lambeth Company feel unable to give a definite assurance that their area will be fully dealt with before the end of 1898. Treating of a very different subject, it is mentioned that during the year upwards of 1,600 tons of explosives, in the course of conveyance into or through London, came under the notice of the Council's inspectors. Respecting the storage and sale of explosives in the Metropolis, the facts are said to show that

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

gunpowder is largely going out of use for small-arm ammunition, and nitro-compound powders are taking its place. These are spoken of as probably safer than ordinary gunpowder—at least, under the conditions which prevail on gunmakers' premises. In another direction we find that the duties of the Council's officers in the examination of weights and measures, the number of which is extraordinary, have recently been increased in consequence of the use by publicans of glass in place of pewter measures, which are now being discarded. Certain local authorities in the north of England and elsewhere having largely reduced their scale of fees for verifying and stamping glass measures, there has been danger that the whole of the glass measure manufacture would be driven out of London. To prevent this result, the London County Council have resolved to make no charge for stamping, but to charge for unpacking and repacking the glass, and for the storage of the articles. The Control Department also has cognisance of the Petroleum Acts, in reference to which it is stated that there is an almost universal disuse of petroleum spirit for domestic lighting, though it is employed largely for outdoor purposes. Lamp accidents during the year caused the loss of forty lives in London, a decrease compared with the previous year. The quantity of petroleum spirit imported into the Metropolis is less than a twentieth part of the amount of petroleum oil, and the latter remains under no restriction whatever, although the total quantity is enormous, whereas the other can only be kept under license. Coroners and their Courts, and the working of the Infant Life Protection Act, are among the other subjects dealt with.

THE SANITARY INSTITUTE AT LEEDS.

THE sixteenth autumn Congress and Health Exhibition of the Sanitary Institute will be opened at Leeds on Tuesday, September 14, and will be continued throughout the week. It will be presided over by Dr. Robert Farquharson, M.P., LL.D., D.L. The Right Hon. the Lord Mayor of Leeds (Sir James Kitson, Bart., M.P.), who is a vice-president of the congress, is the chairman, and Councillor Womersley the vice-chairman of a large and representative local committee. The congress is arranged in three sections—"Sanitary Science and Preventive Medicine," presided over by Mr. T. Pridgin Teale, M.A., M.B., F.R.C.S., F.R.S.; "Engineering and Architecture," presided over by Mr. Lewis Angell, M.Inst.C.E., F.R.I.B.A., Fellow of King's College, London; and "Chemistry, Meteor-

ology and Geology," presided over by Mr. William Whitaker, B.A., F.G.S., Assoc.Inst.C.E., F.R.S. There will also be a special conference on river pollution, and conferences of municipal representatives, medical officers of health, municipal and county engineers and sanitary inspectors, and a ladies' conference on domestic hygiene. The Congress Lecture will be given by Mr. H. Percy Boulnois, M.Inst.C.E., city engineer, Liverpool, and the Popular Lecture by Mr. Philip Boobyer, M.B., M.R.C.S., medical officer of health for Nottingham. Visits to places of interest and excursions will be made during the week. The health exhibition in connection with the congress will be held in a building now being erected in the Engineers' Drill Ground, Camp Road, and will include clothing, food, cooking, domestic appliances, sanitary apparatus and machinery. The exhibition will be opened by the Lord Mayor of Leeds, and will remain open until October 9. It promises to be a greater success than any previous exhibition held under the auspices of the Sanitary Institute. This is attributable to two causes; first, the rapid and solid growth of the Institute (which, it will be remembered, has attained its majority this year, and can boast of over 2,000 members), and, secondly, the importance of the centre in which it is to be held from a commercial point of view. It will be interesting to know that over 600 delegates have already been appointed to attend the congress and exhibition from all parts of Great Britain, and it is probable that there will be a very large attendance of members and Associates to celebrate the coming of age of the Institute and the Jubilee year. We are informed that although the building in Camp Road will be the largest ever placed at the disposal of the exhibition committee, at the present moment three-fourths of the space available for letting has been taken by leading firms, representing all branches of sanitary science. It is, therefore, confidently expected that the exhibition will be of a most attractive and instructive character. The local secretaries are Dr. Spottiswoode Cameron, Mr. E. A. Pearson and Mr. W. Spinks.

ROYAL COURT THEATRE, LIVERPOOL.

THE disastrous fire which took place in the beginning of the year at the Court Theatre suddenly stopped the progress of the performance, and on July 21 the restoration was commenced with new roofing and new ceiling. accommodation—have been carried out, and now, instead of general dressing-rooms, as formerly, the theatre possesses thirty-six new dressing-rooms, all built on fireproof flooring. Each dressing-room has now a window and ample ventilation. Another improvement is that each dressing-room floor has two fireproof staircases as exits for the artistes. Lavatory accommodation has been provided for these dressing-rooms and also, it may be added, for the staff and general public.

Owing to the limited area of the rooms surrounding the theatre it was a matter of difficulty to increase the size of the old buffet, but by the removal of a staircase the accommodation of this department has been very materially increased. The buffet and the foyer have been refitted and redecorated, principally in white and gold. In addition to the above there have been many alterations under the stage and under the pit.

A new carpenters' shop and one for the engineer, with which is incorporated a fireproof brazier's shop, have been excavated out of the rock. Adjoining them will be found a new bandroom. Under the orchestra and under the pit a fine new room has been made, which can be used for general storage or an additional greenroom. It has, moreover, the great advantage of forming a connection between both sides of the stage. Further to add to the comfort of the theatre, a complete hot-water system of heating has been arranged.

Fire hydrants are provided in the pit, dress circle and gallery, to be used as an additional protection for the public. For the lighting of the theatre gas has been superseded by electric lighting wherever possible. The ventilation has not been forgotten, and the latest improvements have been adopted.

The work was commenced on June 21 last, and the theatre was completely ready for opening on Monday, August 2 (Bank Holiday), for the first performance of the "Trumpet Call." Notwithstanding the extraordinary difficulties which have stood in the way of anything like rapid progress—for instance, the large mass of rock to be removed in the course of the new excavations, the impossibility of getting plasterers owing to the prolonged strike, and consequent substitution of less pliable materials than plaster—the whole of the works have been completed strictly within the short time stipulated in the contract, viz. six weeks.

A shelter verandah has been designed to protect the public waiting for entrance to the theatre in Roe Street. The works have been executed by Messrs. W. Morrison & Sons, builders, of Wavertree, from the designs and under the superintendence of Mr. Edmund Kirby, architect, Liverpool.

THE RATING OF GOVERNMENT PROPERTY.

THE local government and taxation committee of the London County Council, in a report which they have just issued, state that they have under consideration the question of the contributions to local rates in respect of property in the occupation of the Government. As the law at present stands this class of property is not liable to assessment on the ground that the statue of 43 Elizabeth, c. 2, did not make the Crown liable, as the Crown was not expressly mentioned in the Act. It was valued by the Government and contributions to the rates were made on such valuations. From the following return prepared by the valuer to the Council it would be seen that with regard to certain well-known buildings in London, the property of the Government, the annual value of the sites alone in every instance but one exceeded the value of the sites with the buildings thereon as computed by the Government:—

Property.	Government Valuation.	Estimated Annual Value of Site.
Bethnal Green Museum	200	400
Somerset House	7,000	27,450
National Gallery	2,000	6,880
Newgate Prison (excluding Central Criminal Court)	425	4,325
Albany Street Barracks	1,050	2,600
Indian Store Dépôt	1,580	1,125
Treasury Buildings (including Education Office, Privy Council Office and official residences)	5,800	15,386
Dover House	1,084	3,132
British Museum	3,500	14,700

In consequence of individual pressure brought to bear on the Treasury by some of the assessment committees, the Government valuations of some of these properties have now been increased, viz. Bethnal Green Museum, 500%; Somerset House, 22,500%; National Gallery, including new Portrait Gallery, 6,000%; Foreign Office, &c., 25,000%; Albany Street Barracks, 2,000%; Treasury Buildings, &c., 10,500%; British Museum, 10,000%. These increases, however, the committee consider to be insufficient. The present system, the committee point out, allowed the valuation of Government property to be entirely in the hands of the Government valuer, and the rating authority had no influence except indirectly in the matter. This is an entire reversal of the general principle of the law of

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM.
From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 60 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRY BEYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty to twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 12s

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.
The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year £1 8s. The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

valuation, which is that all property liable to rates shall be valued by the rating authorities. Government property was not different from private property in the benefit it received from the services exercised by the local authorities at the cost of the ratepayers, and the ancient distinction between Crown property and local or parochial official property now no longer obtains.

The committee cannot but regard the present system as highly unsatisfactory, and they are of opinion that it is only fair and reasonable that Government property should be placed on the same footing as other classes of property and become liable to assessment in the ordinary way, and they see no reason why the Government should fix the value of their own property any more than the Council and other large ratepayers. The committee intended to recommend the Council to take steps to introduce a Bill to repeal the statute of Elizabeth, but as the matter is now under the actual consideration of a Royal Commission, and as the Council's witnesses will give evidence on the subject in the ordinary course, they have decided to await the report of the Commission.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

THE award of the certificates to the students of the Crystal Palace Company's School of Practical Engineering took place on the 5th inst. at the Crystal Palace. Mr. G. A. Goodwin, past president of the Society of Engineers, presided. Mr. K. G. Hodson, superintendent of the school, read the examiners' report for the summer term of 1897, which is the second term of the twenty-fifth year of the school. Mr. R. J. Money, who examined in the mechanical section, noted the continued improvement shown in the work turned out since he was a student seventeen years ago, and since he examined the section six years ago. Mr. A. Marshall congratulated both the students and instructors on the result of the work in civil engineering. Mr. J. G. Aldridge, reporting on the electrical section, especially commended the work of Mr. Harbord. Mr. Goodwin then presented the certificates. Mr. W. Sims was first in the mechanical engineering section (first year's course), Mr. B. O'Dowda in drawing, Mr. F. Peach in pattern work and Mr. W. J. Wood in fitting work. In civil engineering in the second year's course the most successful students were Mr. O. A. St. John-Kneller, Mr. J. W. Simpson, Mr. J. M. Alvares and Mr.

R. F. Arkwright. In the electrical section Mr. W. T. Harbord and Mr. A. T. Araujo took first places. In the course of a short address to the students Mr. Goodwin spoke of the good work which this school had now for twenty-five years been doing towards educating young engineers. Its progress was continuous and remarkable. Although there was considerably greater competition amongst engineers at present than had been the case in past years, English engineers would always hold their own in any part of the world. On the motion of Mr. Green, a director of the Crystal Palace Company, a vote of thanks was passed to the examiners, and subsequently a similar vote was accorded to Mr. Goodwin for distributing the certificates.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 17553. George Anthony Marsden and John Newton, for "Improved dies for use in the manufacture of slabs or tiles."
- 17616. George Stuart Smith, for "A new or improved sash-fastener, also applicable to opening windows."
- 17617. George Cooper, for "An improved window sash-fastener."
- 17658. Alfred Davenport Dixon, for "Window blind-fastener."
- 17917. Carl Theodor Dorr, for "Improvements in apparatus for closing and opening bulkhead doors."
- 18010. Samuel Hill and Rowland Hodges, for "Improvements relating to door-closing appliances."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from 1/4th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address: "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

NORHAM-ON-TWEED.—Aug. 30.—For alterations and additions to farm buildings at Mount Carmel. Messrs. Hamilton, Mount Carmel Farm, Norham-on-Tweed.

NOW READY,

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 Inches by 15 Inches, Price 42s.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says:—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist, however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately: there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

PUBLISHER, P. A. GILBERT WOOD,

OFFICES OF "THE ARCHITECT," 175 STRAND, LONDON, W.C.

PLUMSTEAD.—Aug. 31.—For erection of 572 feet brick and concrete walling, surmounted by wrought-iron unclimbable fencing, to enclose portion of the Plumstead cemetery next Lodge Lane. Mr. H. H. Church, architect, William Street, Woolwich.

RAMSGATE.—Sept. 1.—For erection of a wall to enclose the proposed addition to cemetery. Messrs. Hinds & Son, 57 Queen Street, Ramsgate.

ROTHERHAM.—For a mission church at Canklow. Mr. E. Isle Hubbard, architect, Moorgate Street, Rotherham.

ROTHERHAM.—Sept. 6.—For addition to the Seafeld Arms Hotel. Mr. R. B. Pratt, architect, County Bank House, Elgin, N.B.

SALISBURY.—Aug. 31.—For erection of a sorting office near station. Messrs. Welch & Atkinson, 10 Lancaster Place, Strand.

SCOTLAND.—Sept. 4.—For erection of public baths at Great Junction Street, Leith. Mr. Simpson, town architect, Town Hall.

SHEFFIELD.—Sept. 4.—For alterations and additions to the main building at the Sheffield Union workhouse. Mr. C. J. Innocent, architect, 17 George Street, Sheffield.

SHREWSBURY.—Aug. 31.—For erection of private school, for forty boarders. Mr. A. E. Lloyd Oswell, architect, Dana Chambers, Shrewsbury.

SHREWSBURY.—Sept. 2.—For construction and erection of engine and boiler-houses, coal stores, chimney shaft and other works at Coleham. Messrs. John Taylor, Sons & Santo Crimp, engineers, 27 Great George Street, Westminster, London, S.W.

SOUTH BENWELL.—For renovation of and alterations to buildings at South Benwell Works, for the Edison & Swan United Electric Light Co., Limited. Mr. Thos. Hanning, Northern Assurance Buildings, Collingwood Street, Newcastle-on-Tyne.

SOUTHOWRAM.—Aug. 31.—For building a retaining wall in Shibden Hall Road. Mr. W. H. D. Horsfall, 9 Harrison Road, Halifax.

STAINFORTH.—Sept. 1.—For erection of a wash-kitchen to the cemetery cottage. Mr. James Dyson, Silver Street, Stainforth.

STROUD.—Sept. 7.—For erection of a chimney-stack and flue at the workhouse. Mr. Fredk. Winterbotham, John Street, Stroud.

UXBRIDGE.—Aug. 31.—For erection of a fire-escape house. Mr. William L. Eves, 54 High Street, Uxbridge.

WADSLEY.—Sept. 18.—For erection of additional wash-house, engine-room and laundry at the asylum. Mr. Cotterill, Wadsley Asylum, Sheffield.

WALES.—Sept. 11.—For the restoration of Llanfihangel-y-Creuddyn Church tower. Rev. J. P. Evans, vicar, Llanfihangel Creuddyn.

WALES.—Aug. 31.—For erection of detached villa residence at Llanwryd Wells. Mr. H. Teather, architect, Andrew's Buildings, Queen Street, Cardiff.

WALES.—Aug. 31.—For rebuilding Panteg Congregational chapel, Ystalyfera. Mr. W. Watkin Williams, architect, 63 Wind Street, Swansea.

WALES.—Sept. 15.—For erection of forty-five cottages at Pontycymmer. Ffaldau Collieries Company, Limited, Cardiff.

WALTHAMSTOW.—For pulling-down and rebuilding 43 and 45 St. James Street. Mr. J. Williams Dunford, architect, 100c Queen Victoria Street, E.C.

WAR DEPARTMENT CONTRACT.—Sept. 5.—For erection of a canteen and works in connection therewith, at the Royal Military College, Sandhurst, Berks. Plans, &c., Royal Engineer Office, North Aldershot.

WARRINGTON.—Sept. 20.—For erection of county asylum on the Winwick Hall Estate, Winwick, near Warrington. Mr. Fred. C. Hulton, clerk, County Offices, Preston.

WATERLOOVILLE.—Aug. 31.—For enlargement of the schools at Waterloo. Messrs. Rake & Cogswell, architects, Prudential Buildings, Portsmouth.

WHITEHAVEN.—Aug. 31.—For alterations to 22 and 23 King Street. Messrs. Moffat & Bentley, architects, Whitehaven.

A SERIOUS accident happened at Stockport a day or two since. Some workmen were engaged demolishing old gas-works, which are to be replaced by an electric-lighting station, when part of the building suddenly collapsed, and three men, named William Maull, Peter Higgins and Joseph Woodall, were precipitated into some disused tanks below, a distance of 40 feet. The men were quickly rescued, but they lie in the infirmary in a critical condition.

TRADE NOTE.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent Manchester grates to the new infirmary, Easthamstead, Berks.

BUILDING AND BUILDERS.

It is proposed to enlarge St. Paul's Church, Newbarns, Barrow-in-Furness, at a cost of 2,500*l*.

THE memorial-stones of a new Welsh Wesleyan church at Acrefair, a mining district near Ruabon, were laid on the 18th inst.

THE tender of Messrs. Morrison & Mason, Glasgow, to erect a new bridge at Millbrae, Renfrewshire, at the cost of 4,523*l*. 12*s*. 6*d*., has been recommended for acceptance by sub-committees of the Glasgow Corporation and Upper Renfrewshire committee of the County Council.

THE contract for the new premises of the London and Yorkshire Bank at Morley has been let to Messrs. Murgatroyd, builders, of Idle. The work has been commenced, and is being carried out from the designs and under the superintendence of Mr. William Bakewell, F.R.I.B.A., Leeds.

AT the meeting of the Bognor Urban Council on the 20th inst. attention was called by Mr. Tate to a statement contained in a letter received from Sir Allen Sarle, secretary of the Brighton Railway Company, at the last meeting, to the effect that six local builders had been invited to tender for the reconstruction of the shelter at the railway station, blown down last spring, and that none of them had responded. Mr. Tate said he had

made inquiries and could not find that a single Bognor builder had been asked to tender for the work. After a short discussion it was decided that the Clerk should communicate with Sir Allen Sarle, enclosing the copy of a letter written on the subject by six local builders.

ELECTRIC NOTES.

SATISFACTORY progress is being made with the installation of electric arc lamps up Haverstock Hill and through High Street, Hampstead, and, by an arrangement made by the vestries of Hampstead and St. Pancras, the whole of the main thoroughfare leading from a point a little north of Oxford Street to the top of High Street, Hampstead, will shortly be lighted by electricity. This length of roadway, one of the most important main thoroughfares in the Metropolis, extending to a distance of considerably over three miles, will be the longest in London entirely lighted by electric arc lamps.

THE Yorkshire House-to-House Electricity Company are making extensive preparations to meet the demands for current expected during the coming winter. Their new buildings are now rapidly approaching completion, and the additional generating plant, consisting of four new Lancashire boilers and four combined engines and dynamos, each of 500 indicated horse-power, have been obtained. The company now direct attention to modifications in the system of distribution, which have been approved by the Board of Trade, and which are being carried into effect at a large expense. It is stated that not less than 10,000*l*. is being spent this year in improving the means of distribution in a part of the centre of the city, and the new system will be extended to other central thoroughfares as quickly as circumstances permit. Some slight economy is expected to accrue to the company, but the main object of the change is to add still further to the efficiency and constancy of the supply of energy and the convenience of the customers. It may be explained that hitherto all the company's cables have conveyed electric current at high pressure, and the conversion to low pressure is done by a separate transformer on the premises of each consumer. Under the new system transforming sub-stations are constructed at various points in the centre of the city, at which the conversion of the current from high to low pressure will be effected by means of large transformers to be there installed. Up to the present four of these underground structures have been built, two in Albion Street, and two in Briggate.

PRICE LIST AND ESTIMATES ON APPLICATION.

VARIETIES.

AN appeal is being made for funds for the restoration of Stratford-on-Avon Church. From the designs of Mr. G. F. Bodley the nave is to be resealed and the organ remodelled.

THE Aldershot Hospital, which has been built at a cost of 3,000l., and was designed by Mr. Thomas Davison, A.R.I.B.A., was opened on Friday, the 20th inst., by H.R.H. the Duke of Connaught.

At a meeting of the hospitals committee of Glasgow Corporation, in the City Chambers, Glasgow, it was agreed to erect a new hospital reception house to take the place of the one at present in existence in Weaver Street, Glasgow, at a cost of 6,500l.

THE theatre which Mr. Wyndham is about to erect in Charing Cross Road in proximity to the Garrick, which in size it will resemble, is designed by Mr. W. G. R. Sprague, and is expected to be ready for opening in time for the autumn season of 1898.

THE fine new bells in St. Patrick's Cathedral have attracted a great deal of public attention and deservedly, for they are undoubtedly a fine peal. From the height at which they are placed—about 120 feet—in the splendid tower built in 1370, their music can be heard at a considerable distance.

UPWARDS of 100 men are hard at work clearing away all the old property standing between Furnival Street and Fetter Lane, the greater part of the ground being occupied by the Old White Horse, formerly one of the chief coaching houses of London. The mortar is said to be as hard as rock.

THE new administrative block at the Chester Isolation Hospital, in Dialstone Lane, which has been erected for the convenience and necessary comfort of the master, matron, nurses and staff generally, was opened with some little formality on the 18th inst.

THE masons in Edinburgh and Leith came out on strike at the beginning of the month for a reduction of hours to 45 per week, but while a number of smaller firms granted the demand the larger ones held out, and now the situation has been complicated by a similar demand being made by the carpenters and joiners.

SOME sixty workmen employed by Messrs. Harrison & Spooner have commenced repainting and redecorating Blackfriars Bridge. The job will take them three months. The painters are giving the bridge a new coat of purple oxide, the

decorated parts being "mock bronzed," as the technical term goes, and the buttresses will be washed down. The last time the bridge was repainted was in 1888.

THE excavations that are being carried out near the Casino, at Baden-by-Zurich, have brought to light many relics of the time when this district was the great *entrepôt* of the Roman army in Transalpine Switzerland. Interest was first aroused by the discovery of the site of an old Roman military hospital, in the interior of which were found various surgical instruments. Within the last few days, however, a still more valuable "find" has been made in the shape of a villa, which, judging by the treasure already exhumed, must have belonged to a wealthy and art-loving Roman.

GRAND THEATRE, FULHAM.

THE new and handsome theatre which has just been erected at the foot of Putney Bridge, from the designs of Mr. W. G. R. Sprague, was opened on Monday evening. It is built of white Portland stone, in the Classic style, and is entirely isolated, the front being in High Street, Fulham. From the exterior the Grand bears a close resemblance to the Métropole at Camberwell. The interior possesses several noteworthy features. It is 60 feet wide, and the curtain is 65 feet away from the wall of the pit. In the auditorium there are no columns to obstruct the view, and seats have been arranged for 2,239 persons, 1,000 being in the pit, 800 in the gallery, and 239 in the balcony. There are eight private boxes. The Louis XIV. style of decoration is adopted throughout the house. The centre panel of the ceiling is dome-shaped, with four medallions in mitres filled in with painted subjects. All the decorative work is treated in delicate shades of cream and light terra-cotta. There is a good deal of gilding, but not so much as to make the surroundings look heavy. The stalls, carpets, and draperies are of a rich ruby colour, and all the reserved seats are very comfortable. The stage is spacious and large enough to take some of the biggest "sets." From the curtain-line to the back wall it is 65 feet, and the width is 76 feet. The proscenium opening is 30 feet wide and 28 feet high, and the height from the boards to the grid is 56 feet. The dressing-rooms are airy apartments, and close to them some bath rooms have been fitted up. The whole theatre is lighted by electricity generated on the premises, and preparations have been made for the cold weather by an improved heating apparatus.

LAUNDRY MACHINERY AND MOTOR-CAR
EXHIBITION.

THE exhibition opened at the Agricultural Hall, Islington, on Monday last, although by no means overcrowded as regards the number of exhibits, nevertheless contains many objects of interest to the visitor. The majority of the laundry exhibits are of the labour-saving order, and among them are several distinct novelties, while among the motor cars some examples of the cabs which are on the streets are shown, and prove to be very comfortable and attractive vehicles.

NEW CATALOGUE.

THE catalogues of Hart, Son, Peard & Co., Limited, are distinguished by one among several peculiarities. The traditions of the Gothic movement appear to be still influential in the workshops. The designs employed are always marked by fitness, and we might add sobriety. The metalwork is never obtrusive on account of its form or ornament, and in that way differs from much which is now produced in this country and America. The work has another Gothic quality—it is made to endure. These characteristics are to be seen in such small productions as sash lifts, fasteners, sash bolts, door furniture, bell levers, door handles, brackets, &c. The firm have to recognise that Mediæval forms are no longer dominant; but the thoroughness and good taste which they exhibited half a century ago inspire their treatment of later styles. The latest issue is Section 7, which relates to builders' ironmongery. The catalogue is comprehensive, and includes examples in all departments. Considering the quality of the work, the prices are most moderate, and we need hardly say that in the long run the goods are more economical than some which are offered at lower prices. There is also the satisfaction of knowing that the articles will correspond with the descriptions of them. It is more satisfactory to have one's own designs carried out, but

there are occasions when time will not admit of that arrangement, and on such occasions it is advantageous to have a stock available like what is found in the Drury Lane warehouse, in which design, workmanship, and material are praiseworthy.

GLASGOW CORPORATION AND BETTERMENT.

THE following report of the special committee on betterment has been presented to the Glasgow Corporation:—

The committee have carefully considered the remit made to them by the Corporation on April 1 last—viz., to consider and report on the following motion by Councillor Ferguson, viz.:—
“For the purpose of carrying out the principle of betterment and sustaining the Corporation in its contemplated expenditure for improvement of the city, power to be sought from Parliament of the kind suggested by the Commission upon the Housing of the Poor—viz. a rate of four per cent. per annum upon the selling value of all land within the city boundary.” The committee have resolved to recommend that the Corporation, having approved of the principle of betterment, should remit back to this committee to take steps to get a general bill containing provisions for carrying out the purposes thereof. In making this recommendation the committee think it right to place before the Corporation the data on which they have proceeded, and the information which has been before them in connection therewith, and beg to submit the following extracts from the report issued in 1889 by the Commissioners appointed in 1884 to inquire into the Housing of the Working Classes. The Commissioners in their report state that—

“They are of opinion that until some reform is introduced which shall secure contribution to local expenditure from other sources of income received by residents in the locality, in addition to the present rateable property, no great progress can be made in local improvements. In connection with any such general consideration of the law of rating attention would have to be given to the following facts:—At present land available for building in the neighbourhood of our populous centres, though its capital value is very great, is probably producing a small yearly return until it is let for building. The owners of this land are rated not in relation to the real value, but to the actual annual income. They can thus afford to keep their land out of the market, and to part with only small quantities so as to raise the price beyond the natural monopoly price which the land would command by its advantages of position. Mean-

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of “The Pittman Paint” accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

time the general expenditure of the town on improvements is increasing the value of their property. If this land were rated at, say, 4 per cent. on its selling value, the owners would have a more direct incentive to part with it to those who are desirous of building, and a twofold advantage would result to the community. First, all the valuable property would contribute to the rates, and thus the burden on the occupiers would be diminished by the increase in the rateable property; secondly, the owners of the building land would be forced to offer their land for sale, and thus their competition with one another would bring down the price of building land and so diminish the tax in the shape of ground rent, or price paid for land which is now levied on urban enterprise by the adjacent landowners, a tax be it remembered which is no recompense for any industry or expenditure on their part, but is the natural result of the industry and activity of the townspeople themselves. Your Majesty's Commissioners would recommend that these matters should be included in legislation when the law of rating comes to be dealt with by Parliament. . . . This leads to the consideration of a most important question connected with compensation and the incidence of rating—the principle which is known by the name of betterment. It is the principle that rates should be levied in a higher measure upon the property which derives a distinct and direct advantage from an improvement instead of upon the community generally, who have only advantage of the general amelioration in the health of the district. American legislation has adopted the principle that where public improvements are effected by the local authority they ought to be able to bring in aid of the cost of the improvement any additional value conferred on the adjoining property by reason of the improvement."

In addition to the above extracts from the report of the Commissioners, the committee desire also to place before the Corporation the following observations by Mr. Jesse Collings, M.P. (one of the Commissioners), contained in a memorandum prepared by him supplementary to the report which he had signed. In that memorandum he states that "The principle of 'betterment' which is recognised in the Artisans' Dwelling Acts, 1879-82, in cases where property belonging to the same owner is benefited should be extended. The owners of adjacent property who have been directly benefited by any public improvement should be called upon to pay such an extra rate as would constitute a fair share of the cost of such improvement. Mr. Forwood, who has had experience of the working

of this law in America, speaks of it in his evidence as 'an admirable and very fair arrangement.' At present the owners of ground-rents pay nothing directly towards the rates of a locality. It is contended that the rates for land are paid indirectly through the occupier; but, even admitting this to be the case, it is evident that all increase in the rates and all new rates must fall entirely on the householder. The ground landlord—the future value of whose property is so largely increased by no effort of his own, but by the industry and outlay of the community—pays nothing as a rule, even indirectly towards the repayment of short loans and other expenses for new improvements, or for increasing local expenditure of any kind. It should be a recommendation that all ground-rents should be directly rated in support of local burdens."

For 200 years this principle (betterment) has been worked in the United States. Windsor, in his history of Boston, tells how between 1866 and 1872 most of twenty-two millions of dollars was spent in street-widening. The Boston Improvement Act of 1866 permitted 50 per cent. of an appropriation of the property specially benefited. "Thus without hardship to the numerous individuals whose property was taken, and without large expense to the city," improvements vastly greater than those contemplated or realised in Glasgow were accomplished. A proprietor who got 100% per year from the improvements was not likely to feel aggrieved at being asked to contribute 50%. Of course, some men holding fast by the old-world ideas which enabled the landholders of Great Britain to obtain ruinous amounts as compensation from railway companies for increasing the value of the properties through which the lines were laid fought the Corporation, with results as follows:—The Chancellor told Mr. Livingston in the New York Court he could claim no damages for sustaining a benefit. "The owner of property taken is entitled to full compensation for the damage he sustains thereby, but if the taking of it for public improvement is a benefit he certainly has no claim for damages. So thoroughly is this equitable principle applied that in Massachusetts it is not uncommon for a railway company, in response to a claim for land taken by the company, to furnish and obtain the balance between that claim and a larger sum—the betterment—which the railway company had created for that land-owner."

Forty different legislatures have adopted the betterment principle, representing the keenest commercial people in the world. "Payment according to benefit" is daily becoming more firmly rooted in American law. In some States two-thirds

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

of the cost of improvements are taken from persons benefited, and one-third from the public. Judge Stedell of Louisiana held that paying for local improvements out of general funds was inequitable, and opened a way for injustice and extravagance. He held the betterment tax to be safer as well as juster. In fact, the Supreme Courts of different States lay it down that "betterment" is not a tax, but a mere contribution for value received. This reply was given to Brown's University, which claimed exemption from betterment on the ground that its character exempted it from rates and taxes, and it had to pay accordingly. Dillon, in his handbook of American Municipal Laws, quotes the statement of a judge of the Supreme Court of Missouri that the principle of betterment has been subjected to severe analysis in every State of the Union, and adds, "It is now as firmly established as any other doctrine of American law, while the tax itself has become the usual form of assessment for new municipal work of every description. After much opposition and fierce litigation the public mind has at length everywhere acquiesced in its reasonableness and equity."

This committee asks the Town Council of "the most progressive municipality in the world" to add one more to its laurels, and, whilst the influence of landowners, aided by land conveyancing lawyers, has defeated or rendered useless by legal expenses the efforts of Manchester and London to follow the wise example of the American cities, let Glasgow show she is determined to free labour and capital from the terrible injustice of producing the harvest for the sole use of those who only contribute an ordinary share to its production. Mr. John Rae, in an article on "Betterment" in the *Contemporary*, says the betterment tax rose spontaneously out of natural considerations of equity and convenience. The seeds of the idea may have been carried across from England. As far back as Henry VIII. the germs of betterment appear, but never developed further in this country, being choked by the all-conquering tendency of legislation to favour real estate (landlords), but in America they have grown and flourished, until now there is scarce a city in the Union that does not sit under the shelter of its branches.

The principle the committee desires the Council to put into a Bill has now been accepted by the Government, and is embodied in a Bill of the London County Council, 58 and 59 Victoria (Tower Bridge Approach Bill). "The amount to be charged is 3 per cent. per annum upon one-half of the amount which the Council allege is the enhanced market value derived by said lands from the improvement."

A JEWISH SETTLEMENT IN ESSEX.

SOME time ago Mr. Robert Varty, of 90 Leadenhall Street, purchased some estates of about 1,200 acres immediately contiguous to his residence at Jarvis Hall, Rayleigh, Essex. These estates lie in the three parishes of South Benfleet, Thundersley and part of North Benfleet. Mr. Varty was able, as he told a representative of the *Westminster Gazette*, to purchase this land at a price which enables him to sell cheaper than the original holders obtained it. The reason of course was the downward tendency in prices and the increasing difficulties of the farmers to pay the tithe and other charges upon the land. Mr. Varty (who has his own remedy for agricultural depression) has cut up the estates into small plots. He has already sold about 800 acres.

When the sales were first held a few Jews were present, but last week two or three hundred Israelites attended the auction, and this number included several rabbis and prominent members of the London Synagogue. As the result of the day's sale, about 300 lots were sold, the total price realised being 3,386*l*. There was no mistaking the nationality of the purchasers, the auctioneer's lists including such names as Goldstein and Moses and other typical cognomens. All these men paid the deposit at once—some even handed over the purchase-money. According to Mr. Varty, these new Essex settlers are men in a small way in the East End. Some are tailors and shoemakers, others make small articles for the coster and the huckster, or they peddle themselves.

The plots of ground are 20 feet broad and some 160 or 170 feet in depth, sufficient to erect a house and leave space for a garden. These Jews are of Polish or Russian extraction, and by dint of years of industry in England have acquired the wherewithal to purchase in some cases several plots of ground. A glance at the lists showed that in one case 232*l*. had been paid by a Jew, but this was probably in the nature of a speculation. The plots, however, unless they were in some specially good position, fetched between 4*l*. and 5*l*.; the only other expense that the purchaser was put to was 6*d*. for a Government stamp to affix to the deed of conveyance.

It is evidently the intention of the Jews to establish a regular colony here. Plans are being got out for houses; one or two small factories are to be built, whilst an enterprising East End fish merchant is going, it is said, to build a refreshment house. Some 400 acres are still to be disposed of, and, judging by the way that Moses and his compatriots are crowd-

ing into Mr. Varty's office during these days, asking particulars and filling up schedules, it seems likely that this further estate will be completely occupied by Jews.

The poorer Jews, hitherto, have hardly been suspected of rural tendencies; some of us have even come to believe that their natural atmosphere was in the reeking slums. But Mr. Varty has been making inquiries, and he finds that many of the Jews who are migrating to the country entirely of their own accord and without any extraneous assistance—this indeed is the remarkable feature of it—were originally brought up on the land, and have retained in all these years of chaffering the real heart of a peasant. One idea these people have is to build houses in which they may let lodgings for their brethren in the summer. Others will adopt small culture and go in for flowers, fruit and vegetables, for which they expect a good sale in Southend. The estate is served by two railway stations, and there is the river besides.

BILSTON WATERWORKS AND TECHNICAL SCHOOLS.

BILSTON was *en fête* on the 12th inst. on the occasion of the opening of the new and important waterworks and the technical schools. The water supply, as furnished by the Wolverhampton Town Council, having been found for some years totally inadequate to the requirements, steps were taken to secure an independent supply, land was secured at The Bratch, at Wombourne, and, water of a pure quality having been found, the necessary plant was laid down. The works opened on Thursday include engine-house, well-house, boiler-house, machine-fitting and repairing shop and stores, while the plant consists of two boilers, two engines and two sets of pumps, with the usual accessories. All the machinery is in duplicate, in case of a breakdown. The total cost of the scheme is 45,000*l.*, and the work has been designed and carried out by Mr. Baldwin Latham, M.I.C.E., of Westminster, while Mr. C. L. N. Wilson (the town surveyor of Bilston) has acted as resident engineer. The technical schools situated on the Willenhall Road, within a short distance of the town hall, have been erected on 1,433 square yards of land, which was purchased at a cost of 217*l.* The architect is Mr. C. L. N. Wilson, the surveyor to the district council, and Mr. T. Tildesley, of Willenhall, is the builder. The style is Italian, and the front elevation has been carried out in red brick and terra-cotta, and presents a very effective appearance. The

building comprises large lecture and examination-room, and fourteen small rooms, which will be used as small workshops and laboratories. The total estimated cost is 6,000*l.*

THE PUBLIC HEALTH ACT.

AT the meeting of the Association of Burgh Officials held in Dunfermline on the 20th inst., Mr. James Donaldson, the secretary, read a paper on the "The Public Health Act," which he said practically repealed all the existing Public Health Acts except one, namely, the Act of 1891. The effect of it was that, while sewers constructed under the Public Health Acts were formerly required to be paid for by occupiers, such sewers would now fall to be paid for half by owners and half by occupiers; but, on the other hand, sewers constructed under the Act of 1892 are still required to be paid for wholly by owners. Further, while water supplies provided by the Public Health Act of 1867 were in some cases (following the prison assessment) payable equally by owner and occupier and in others wholly by occupiers, they would now fall to be rated for half on owners and half on occupiers; but, on the other hand, similar works provided for under the Police Act would be levied wholly on occupiers, and, curiously enough, the rate for water supplies provided in future under the Act of 1892 would fall wholly upon occupiers. The new Act would come into operation on January 1, 1898. The assessments were imposed in September or October in each year for the year till May 15 following. In assessing for the current year he was afraid they must levy in accordance with the present Act, as the only one then in force. A new clause had been introduced into the Act providing that the ratepayers of a burgh were not to be assessed for any charges or expenses incurred by a County Council for the salaries or expenses of the medical officer or sanitary inspector appointed for the county. This removed an injustice felt in many burghs. It was provided that loans for the purposes of the Act were to be repaid within a period not exceeding thirty years. In borrowing for sewers constructed under the Burgh Police Act, the capital would not be repaid for thirty-three and one-third years, while in borrowing for similar sewers constructed in burghs under the Public Health Act the amount must be repaid within thirty years. All this meant greater trouble and confusion in dealing with borrowings and sinking funds, and no good ground existed for the difference that had been made. In concluding, the Secretary said it would be seen that, while the Public Health

SOHO COWL AND VENTILATOR (NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to any one suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

NOTICE.—Further Views of St. Paul's
Cathedral will be continued in a future number.

Act might be a useful measure, it had left in an unsatisfactory state much that stood in need of amendment, and while deeply regretting that Parliament should have delayed putting matters right, they could only express the hope that the anomalies and difficulties might be removed by a Bill next session.

PROPERTY IN POSSESSION OF BUILDING SOCIETIES.

ON August 25, 1894, an Act was passed for the regulation of building societies, but in order to avoid risks which might arise from immediate application one of the sections was allowed to remain in abeyance for three years. The time having elapsed it is now in operation, and will henceforth regulate the power of building societies to receive money on deposit or as loans. Up to August 1894 building societies were by a previous Act of 1874 enabled to receive money on deposit or as loans to an amount not exceeding two-thirds of the aggregate sum which had been lent on properties by way of mortgage. The disclosures which followed the failure of the Liberator and other less famous building societies led Parliament to call for a return from all building societies of what is known as their "properties in possession." Out of 2,249 societies in England and Wales 210 failed to make any return, "notwithstanding repeated applications by the Secretary of State," whilst 681 acknowledged that their properties in possession stood in their books at 3,565,309*l.*, upon the security of which they were able to receive deposits to an amount not exceeding two-thirds of that sum. It was this startling return that induced the Government to insert in their Bill the clause which now takes effect, prohibiting building societies from receiving any money on deposit or as a loan upon the security of any property in the possession of the society, or upon any property on which the mortgage repayments are more than twelve months in arrears. The words of the clause are as follows:—

"In calculating the amount for the time being secured to a society under the Building Societies Acts, by mortgages from its members, for the purpose of ascertaining the limits of its power to receive deposits or loans at interest, the amount secured on properties the payments in respect of which were upwards of twelve months in arrear at the date of the society's last preceding annual account and statement, and the amount

secured on properties of which the society had been twelve months in possession at the date of such account and statement, shall be disregarded."

At the time of the introduction of this clause into the Bill it was fully recognised that many building societies would have to overcome considerable difficulties in complying with its provisions, and to avoid forcing societies into liquidation the House of Commons suspended the operation of the clause "until the expiration of two years from the passing of the Act," and protected existing depositors by the insertion of a proviso, "That this section shall not affect the validity of any deposit or loan which was within the limit provided by law at the time when it was received." In this form the Bill was sent to the House of Lords, where powerful representations were made to Lord Herschell, who had charge of the Bill, that two years was an insufficient time to enable many building societies to bring themselves within the limits of the new borrowing powers. As the result of these representations the House of Lords extended the operation of the clause for a further period of twelve months, making three years in all.

From the returns which have been recently made by building societies it is much to be feared that, notwithstanding the three years' grace allowed by Parliament, little or no effort has been made by some societies to reduce their deposits and loans to within two-thirds of the amount of the mortgages upon which repayments are more or less regularly paid. This is in part due to the great difficulty of realising properties in possession for the purpose of paying off loans and deposits. Although the failure of a society to reduce its loans and deposits, where they exceed the limits allowed by the new Act, may not be held to affect the validity of the loans and deposits already taken, future depositors will do well to make sure that the sum already held by a building society on deposit or loan is well within the limits allowed by the new Act. Fortunately the detailed series of accounts now required from all building societies clearly sets forth this information.

It may be mentioned that since the passing of this clause the Chief Registrar of Building Societies has reported that of the 210 societies who failed to make any return to Parliament of the properties in their possession, sixty-one have now sent in returns showing that they have properties in possession amounting to 1,117,709*l.*, and that twenty-two societies "who stated that they had no properties in possession," now acknowledge that they have such properties, amounting, however, only to 23,263*l.*

THE EDUCATION OF ENGINEERS.*

IN this ever memorable year of the Victorian age, it is not unnatural that any one called to fill the chair I occupy to-day should experience a sense of oppression when contemplating the fruits of mechanical science during the last sixty years, and the tremendous vista, fading in the distance to a dream, of the fruits it is destined to produce before such another period shall have passed away. There would be no possibility, in the time at my disposal, even if I were qualified to attempt it, of adequately reviewing the past; and, however fascinating the thought may be, it would ill become my office to venture too far along the vista before us, lest a too airy imagination should break the bonds of that knowledge and that truth to which she must ever remain, in our rightful speculations, a helpful, if not always an obedient, handmaiden. In the year 1831 two places, the one ancient and memorable, the other young, but destined to become memorable, bore the name of York. At the first of these, amid relics of ancient Rome and lasting memorials of the better phases of Britain's Mediaeval history, were met together in that year the earliest members of the British Association. And as the sun at noonday shone on that ancient York, it rose upon the other York—a little town, scarcely more than a village, of 1,700 people, fast springing from a plain on the shores of Ontario, where the wigwag of the Chippewa had lately been; and between the two lay the Atlantic and a distance of 4,000 miles. Sixty-six years later the British Association meets in that other York, distinguished under the name of Toronto and grown into a noble city. Painfully, in stage coaches, must many of the founders of this Association have travelled to that ancient York; peacefully and amid all comfort and luxury have we from the mother country reached, at her invitation, this great city—chiefest in its people, its commerce and its university of the cities of Western Canada. Neither at the meeting in York of 1831 nor elsewhere, until many years later, was there any expectation of the possibility of these things. Six years later, about the beginning of that glorious reign of which the sixty-first year is now passing, although two or three vessels had already crossed the Atlantic under steam, it was still seriously doubted whether, without the aid of a Government subsidy of

considerable amount, a line of steamers, even for the New York service, could be permanently maintained. It was not, indeed, until 1838 that the *Great Western* inaugurated the attempt on a commercial basis, and she performed in fifteen days the voyage which is now regularly performed with complete commercial success in five. Would not the suggestion of such a change, of such a spanning of great distances, of such a consequent growth of prosperity and of culture, within the reign of a princess then approaching womanhood, have been received as the wildest of forecasts by the British Association of 1831? Yet this is but one of a multitude of results, no less startling, which the same agencies have brought about. We are now holding the second meeting of the Association in Canada, and at the first such meeting, held thirteen years ago in Montreal, some hundreds of miles nearer home, Sir Frederick Bramwell told you from this chair, in his own inimitable way, the causes of so great a change, and he pointed out to you, as I venture to point out again, that the visible instruments of that change have been forged by the men who are, or were, or ought to be, the members of Section G. To such encouragement as Section G has given is largely due the progress and triumph of applied mechanics as the natural outcome of theoretical investigation and physical research.

The Training of Engineers.

If we look back at the greatest names among the engineers and inventors of the latter part of the eighteenth century and the first half of this we find that the majority were brought up in pursuits quite distinct from the work of their after lives and by which they have become so familiar to us. There were scarcely any means whatever beyond the original thought and dogged perseverance of the worker, by which those men could attain the knowledge they used with such effect. Men of no less exceptional parts are among us now, but the whole environment of their early work has changed. We have given to the exceptional man a starting-point of knowledge which, wisely used, lifts him as high above our heads as of old, but we have given to the average man a comparatively easy means of attaining the same knowledge. We cannot insure the wise use of that knowledge, but we can at least endeavour to impart it in such a manner that the sense of right proportion shall be acquired and maintained. We have made it more difficult to distinguish between the exceptional and the commonplace—between the gold and the silver, if not between the silver and

the brass; let us be careful, so far as early guidance can control it, that the knowledge imparted to the average mind gives to that mind a fair start concerning the relations, undivided and indivisible, between true theory and sound practice. Having myself passed as an ordinary apprentice through workshops of mechanical engineering in the old days when working hours were longer than they now are—from six in the morning till six in the evening, and that, too, on the banks of the Clyde, where no special indulgence was given to what was sometimes called the "gentleman apprentice," and feeling convinced, as I still do, of the immense and permanent advantage derived from that experience, I shall not be judged to underrate its value in the case of others who have yet to choose the details of the career by which they expect to gain a place in the profession or business of an engineer. On the other hand, as a student thirty-four years ago under the late Professor Macquorn Rankine and the present Lord Kelvin, I shall not be prone to underestimate the advantages of academical training in its proper application to the profession to which I am proud to belong. In the pursuit of that profession it has fallen to my lot to observe the training as engineers of many younger men—men of variously constituted minds, but one and all bent on learning some portion of "the art of directing the great sources of power in nature for the use and convenience of man," words wisely chosen sixty-nine years ago and set out as the object of the profession in the Royal Charter of the Institution of Civil Engineers. It is a noble object, this direction of the great forces of nature for the use and convenience of man; it is an ambitious object, and one which I venture to think demands for its right performance the best energies of well-balanced minds working upon a store of knowledge which nothing but years of untiring study and observation can give. Yet there is no hesitation shown to enter the lists. The number of candidates is appalling. In the old country, at least, there certainly is not work for all, but when one points this out, anxious parents only reply that the difficulty is as great in connection with any other profession. Whether this be so or not I cannot judge, but I am persuaded that of those who do enter the business or profession of the engineer, the enormous majority are not born engineers, and cannot, in the nature of things, hope for success unless they take advantage of the best facilities open to them—the best facilities; here is the difficulty, from the multitude of facilities how are we to choose? Do not suppose that I think the training of the born engineer should not be controlled. He

will stand head and shoulders above the rest of us whatever we may do with him; but in order that his exceptional parts may not wreck him as an engineer, and in order that his energies may be rightly directed at the start, he, too, should have the advantages of that systematic training which to his less gifted brethren is becoming more and more absolutely essential to success. At the time I began practice the large majority of young engineers were left entirely to their own devices so far as the attainment of any scientific knowledge was concerned. As pupils or apprentices, articulated or not, they entered an engineer's works or office; for a certain number of years they had the run of the place and some encouragement if they worked well, but it could not, in the nature of things, amount to much more. This was a very necessary, perhaps the most necessary, element of their training; but except to the few who were so constituted that with little or no guidance they could supplement their practical knowledge with the study of principles elsewhere, it was entirely ineffectual in the production of that well-balanced attitude of mind which any person who properly assumes the name of an engineer must hold towards every engineering problem, great or small, which he is called upon to solve. And so strongly have I felt this that in the earlier days, when there were fewer schools of practical science, and when their utility was little understood, I required, wherever the matter was under my control, the insertion into the articles of apprenticeship of a clause by which, at some inconvenience to the office, the pupil was required to attend two sessions at the science classes of Glasgow University or at some other approved school of practical science, and without this condition I declined to take the responsibility attaching to the introduction into the profession of men who, in their earlier careers, from no fault of their own, had not even acquired a knowledge of what there was to learn, much less of how to learn it. More recently this course has generally become unnecessary, for in Westminster, at least, the young engineer rarely enters an office until he has acquired some knowledge of what he has to learn. He enters, in short, at a much more advanced age than formerly. When it is essential that he should be earning something soon after he comes of age, anything like a complete training is an impossibility; his work ceases to be general, and his practice is more or less confined in a much narrower sphere than need be the case if the pursuit of further knowledge continues to be his chief duty. But whatever course his circumstances may permit him to adopt, the difficulty of gaining the required knowledge in the time available

REPRODUCTIONS OF

The FINEST EXAMPLES.

is a serious one. This is not the place to inquire whether public school education in the mother country is, or is not, the best for the general purposes of after life, or to discuss what improvements may be made in it; and of higher education in Canada I unfortunately know little or nothing. Personally I admit the possibility of improvement in the English system, and slowly but surely improvement is creeping in, as such changes rightly find their way into institutions which have done so much for Englishmen. In this particular I lean to the conservative side, and whatever our individual views may be concerning the time spent on the study of Latin and Greek we should all probably agree that the school education of an engineer should be as thorough and liberal as for any other profession. But for the sake of a technical training to follow, this school education is often unduly curtailed, to the great after-grief in very many cases of the successful engineer, and not infrequently also in the case of the less successful engineer, who in some phases of his professional career has been only too keenly alive to the self-reproach and sense of inferiority which want of thoroughness or of time, or of both, at school has brought upon him. But at some time the boy must leave school. Let us hope that he does not aspire "to control the great forces of nature;" but if he does we must make the best we can of him. It is not desirable, at least so it appears to me, that even at this stage his training should be specialised in view of the particular branch of the profession or business he is likely to follow. The fundamental principles of any branch of mechanical engineering are broadly the fundamental principles of any branch of the profession. I hesitate to speak of civil engineering as if it were a separate branch, instead of being, as it really is, the generic name of the profession; but the training demanded for the various branches of civil engineering in its narrower sense is precisely the same as that required in its earlier stages for mechanical engineering pure and simple.

Principles, not Details.

I shall make no attempt to review the large number of excellent courses which are now available for the teaching of applied science in relation to engineering. Experience of the results as judged by the students who have come directly under my notice, and examination of many calendars has aroused various thoughts concerning them, and this thought is perhaps uppermost—Are we not in some cases attempting at too early a stage the teaching of subjects instead of principles? Complete subjects, I mean, including the practical working of details which will become the regular study of the student in the office or works of an engineer. It certainly seems to me to be so. I do not say that subject training of this kind at college may not be useful; but we have to consider whether it does not, for the sake of some little anticipation of his office work, divert the attention of the student from the better mastery of those principles which it is so essential for him to grasp at the earliest possible time, and which do not limit his choice in the battle of life to any branch whatever of the profession or business of an engineer, but which, on the contrary, qualify him better to pursue with success whatever branches his inclination or his opportunities or his means may suggest. Not one in a hundred of us can hope to emulate the careers of exceptional men in our profession, but it is sometimes useful to observe those careers, and whenever we do so we find the very reverse of specialisation. The minds of such men are impregnated with the fundamental principles which we may call the common law of our art; it has happened that their practice has been large in certain branches and small or wanting in certain others, but in any it would have been equally successful. Of no class of men can it be said with greater truth than of engineers that their standard should be sound knowledge of the principles of many things and of the practice of a few. There is some danger in the usual limitation of compulsory subjects in examinations for certificates and degrees. When an examination has to be passed subjects not made compulsory are too often entirely neglected, however important to the engineer they may be. A little learning is certainly not a dangerous thing if within its limits it is sound, and every engineer will in after life be grateful to those who in his student days insisted upon his acquiring some knowledge of the principles of such subjects as electricity and chemistry. At present it too often happens that, unless an engineering student is predestined to practise electrical work or some chemical industry, he begins life as an engineer with no knowledge of the principles of either the one or the other, and chiefly as a result of their neglect for the sake of certain subjects made compulsory for the test he has had to pass, which subjects, too, occasionally include the highly specialised favourites of a particular professor or verge too completely on perfected details which, I venture to think, cannot be rightly mastered in schools. It is natural and right that each professor of a principal subject should seek to make the best, from his own particular standpoint, of every student who attends his lectures or his laboratories; and the professor of a compulsory subject cannot be expected to encourage the inclusion, in a course

already overcrowded, of secondary or collateral subjects which are dealt with by other professors; while, on the other hand, the professors of secondary subjects, such as electricity or chemistry, not unnaturally value chiefly the students who make those subjects their principal work. For these reasons it appears to me that a certain very moderate standard in all such subjects should be made compulsory if a certificate of proficiency, whether by degree or otherwise, is to be given in engineering or even in physical science. In the teaching of mathematics within the Victorian age a considerable change has taken place, and I plead for still a little more change in the same direction where the training of the engineer is concerned. Mathematics, as taught in our public schools—let us say for the Cambridge University Tripos—may be all that is claimed for it as a mode of mental culture; but of kindred mental culture the engineer must necessarily have more than most men, and much might therefore be omitted which, to him at least, has only an abstract value, to the great advantage of his mastery over those branches which at once train his mind and give point and direct utility to his solutions. In America I understand that a college course of engineering generally includes workshop practice designed to supersede the old system of apprenticeship to a mechanical engineer. This fact and other important differences between the English and American practice have only lately come to my knowledge, and before they did so the substance of this address had been written. It might, in some particulars, require modification as applied to Canada, but it remains the result of my observations concerning the conditions of engineering education which obtain in the mother country.

Workshop Training.

A few words now in relation to that physical and mental training gained laboriously, and somewhat wastefully, as I think, at the joiner's bench, in the fitting and turning shops, the foundry and the forge, during the whole course of mechanical engineering apprenticeship. I am convinced that the kind of knowledge which comes of thoughtful chipping and filing and turning and forging, though only applied to a few of the materials with which in after life the engineer has to deal, are quite as important as tables of density and strength to his future sense of rightness in constructive design. The use of such work is not merely to teach one the parts and combinations of any particular machine; in a still higher degree it is the insensible mastery of a much more subtle knowledge or mental power, the application of the senses of sight and touch and force, it may be of other senses also, to the determination of the nature of things. (I am not going to apologise for referring to the sense of force. The vexed question of its separate existence appears to me to have been settled fourteen years ago by Lord Kelvin in his address at Birmingham on "The Six Gateways of Knowledge," and I may well leave it where he left it.) I should altogether fail to describe adequately what this mastery means. It appears to me to be inscrutable. The value and nature of the power can only be appreciated by those who have experienced it, and who have felt its defect in those of their assistants or in others who do not possess it. But the great workshop training has still further advantages. The apprentice is surrounded by skilled workers, from whose example, if he be wise, he learns a great deal; and apart from this it is no small profit to have rubbed against the British workman, to have discovered what manner of man he is, and to comprehend how little the world knows of his best parts. The whole time spent in large engineering works cannot, however, be equally beneficial; the apprentice must take the work as it comes; the most interesting or instructive portions cannot be reserved for him, and he often feels that some of his time is being well-nigh wasted. A few years ago I should not have thought it practicable usefully to substitute for such a course anything that could be undertaken in a student's workshop, however organised; but the impossibility in many cases of including such experience without neglecting something equally important has led me to view with satisfaction the introduction of workshop training into certain schools of applied science in England. Such a change cannot, of course, carry with it all the advantages of experience in the great workshop and of contact with its workers, but those advantages which it does retain may be secured in a shorter time where there is no commercial interest to be served. In Canada and the United States, as I have already said, the principle of the student's workshop has been carried considerably further. Compared with the old country, I believe the number of young assistant engineers who in proportion to the number of their chiefs can find employment in America is much greater, and that it would be practically impossible for the British system of pupilage to be generally employed. Here, therefore, the whole college training of an engineer is designed to fit him for immediate employment in some specific branch of the profession, and up to this point his training is necessarily, no doubt, more academic than in England, where the application of the principles he has acquired at college is still generally left for the office or

works of the engineer. With this difference I am not at present concerned, but I desire to reiterate what I have already said to the effect that where, as in England, the student of engineering has the opportunity of continuing his training in the office or works, it is better that his limited college course should cover all that is possible of the principles of those sciences which may prove useful or necessary to him in after life, rather than that any of them should be omitted for the sake of anticipating the practical application of certain others. The compulsory inclusion of the principles of all such subjects as chemistry, electricity, geology and many others, in science courses intended for a future engineer is desirable not only because a fundamental knowledge of them leaves open a very much wider field from which the engineer may, as opportunity offers, increase his knowledge and practice in the future, but because many of such subjects are inseparable from an intelligent understanding of almost any great engineering work. "Nothing so difficult as a beginning" may be a proverb of rather too far-reaching a nature, but it contains the suggestion of a great truth, increasing in weight as we grow older, and the beginnings of such collateral sciences should therefore find a place in every engineering student's store of early knowledge.

The Conditions of Success.

But after all, when these things have been done in the best manner—when the scientific and practical training of the engineering student has been all that can be desired, it is a matter of general experience among engineers who have closely watched the rising generation that the most successful men in after life are not produced exclusively from the ranks of those whose college course has been most successful. No doubt such men have on the average been nearer the top than the bottom, but it is an undoubted fact that when we class them according to their earlier successes or failure we find the most remarkable disparities. We find many who in academic days gave but little promise, and we miss large numbers who promised great things. These facts are not confined to the profession of the engineer, but they seem to me to be accentuated in that profession. We shall no doubt be right in attributing the disparity to differences of mental temperament and of opportunity; but does it follow that there are no faculties which may be cultivated to reduce the effect of such differences? I venture to think there are. I will instance only one, but perhaps the most important of such faculties, which in my experience among young engineers is exceptionally rare. I refer to the power of marshalling facts, and so thinking, or speaking or writing of them that each maintains its due significance and value. In the minds of many young engineers a mathematical training undoubtedly has the effect of making it extremely difficult to avoid spending an amount of time upon some issues out of all proportion to their importance; while other issues which do not readily lend themselves to mathematical treatment, but which are many times more important, are taken for granted upon utterly insufficient data, and chiefly because they cannot be treated by any process of calculation. I believe that nothing but well-directed observation and long experience can enable one to assign to each part of a large engineering problem its due importance; but much may be done in early training also, and I think ought to be done to lead the mind in broader lines, to accustom it to look all round the problem, and to control the imagination or the natural predilection for one phase from disguising the real importance of others. In the practical design and execution of important works the man will sooner or later be recognised who has the power so to formulate his knowledge, and on the same principles has succeeded in so marshalling and expressing his thoughts as to convey to those by whom he is employed just so much as may be necessary and proper for their use. Such considerations are not, it is true, a branch of mechanical science, but being essentially important to the attainment of maximum usefulness in the application of any science to the various branches of engineering which are the chief ends and aims of mechanical science, they are, I think, worthy of mention from this chair. In proportion as the engineer possesses and exercises such powers he will avoid those innumerable pitfalls to which imperfectly instructed ingenuity is so particularly liable, and to which the Patent Office is so sad a witness; and in the same proportion must always be the useful outcome of the great schools of science which have become so striking a feature of the later Victorian age. In relation to the results of applied science, I have spoken only of the steamship; add the telegraph, and I think we have the most important tools by which the present conditions of modern civilisation have been rendered possible. And more than this, I think we have, in the lessening of space and the facility for intercourse they give, the chief secret of that marvellous development of the empire which this year has so pleasantly and so memorably signalled. Is "Our Lady of" the Sunshine and "the Snows" no nearer to the mother land than sixty years ago? Are the Australias—New Zealand—no nearer to both? Assuredly they are. Would British Africa, would the Indian Empire have been possible to Britain on the

principles and the methods of Imperial Rome? Unquestionably not. Then let me say again that I claim for the objects and the work of Section G a magnificent record, an abiding power for the peace of the world, and for the unity and prosperity of the great empire to which we belong.

GLASS COLOURING BY PENETRATION.

It is proposed by M. Léon Léal to colour glass, not throughout the mass, nor in enamel fashion, but by what he calls penetration. A little silver salt is put on the surface of the glass, which is then heated up to 500 degs. or 550 degs. Centigrade (930 or 1,000 degs. Fahr.). The excess of salt having been removed, the surface appears yellow, the colour penetrating to a depth of 0.17 millimetre when the baking has lasted for about five minutes. After an hour a layer of double that thickness would be coloured; after eighteen hours the colour would have penetrated through a glass plate 1.6 millimetres (1/16 inch) in thickness. In reflected light this yellow displays a beautiful greenish or bluish fluorescence. The intensity of the colouration depends, of course, upon the quantity of salt applied. But very minute quantities suffice. To transfer a lace pattern on glass, e.g. it is only necessary to dip the lace in a 0.001 solution of silver nitrate, and then into potassium sulphide. According to *La Nature*, coloured monograms can easily be obtained in this way, and what is still more interesting, ordinary collodion negatives can be printed on glass in various colours. Silver and copper give a red; gold and iron salts have also been used. When the baking is continued for a long period the colouring matter is renewed from time to time—say, every six hours. The observation has a scientific interest as well. The rate of penetration would probably depend upon the nature of the glass, and upon the atomic volume of the metal.

IMPROVEMENTS IN NEW STREET, BIRMINGHAM.

ANOTHER link in the chain which binds old and new Birmingham together is about to be snapped by the demolition of the extensive block of premises forming the lower part of Cannon Street and Needleless Alley, together with the three shops between the two thoroughfares in New Street. This property is one of the most ancient pieces of old Birmingham existing in the centre of the city. The low-roofed, old-fashioned buildings, with the shop-fronts brought up to the street line, are in strange contrast with the modern commercial houses on either side, and their replacement by handsome shops, erected on the most modern principles, will be a conspicuous improvement to New Street. The change from the old order to the new will be witnessed with regret by the archaeologist and the student of local history, but these may derive some comfort from the reflection that there is still preserved to their thoughtful gaze a remnant of old Birmingham in the interesting block of ancient shops below the Theatre Royal. The property which is now about to be razed to the ground has a frontage to New Street of 66 feet, to Needleless Alley of 164 feet and to Cannon Street of 144 feet. It is cut off from the remaining buildings by a line which preserves the existence of the premises of Messrs. Frank Smith & Wilson in Cannon Street, and continues through to Needleless Alley, opposite the Young Men's Christian Association building. This forms an oblong piece of land which generations ago was part of the old Cherry Orchard. In the early days of the eighteenth century two houses stood upon the site. They were built by one William Guest, and in 1729 were in the occupation of William Weeley and Thomas Abell. Attached to them was a close known as Hipkins's, and there were also four little gardens, two evidently in front, because, according to the old maps and plans, these houses were some little distance removed from the main street. William Guest eventually sold the property to Samuel Russell, an ironmonger, and about the beginning of the present century the principal house was occupied by Dr. Freer, a medical man of eminence in the town. He practised there for many years, and was succeeded by a French physician, naturalised in this country, Dr. Gabriel Jean Marie de Lys; he was one of the honorary staff of the General Hospital. It is difficult to say through whose hands the second house passed; but after the house of Dr. de Lys became tenanted, some time in the "thirties," the houses were turned into three shops by the addition of business frontages which occupied the site of the gardens, and brought the shops up to the line of the street. For a few years the premises were let for a variety of purposes; but in 1845 the most important house, that formerly occupied by the medical men, was taken by Messrs. Bach & Barker, in whose family it remains to the present time. The central shop has for years been occupied by Messrs. Bostock & Co., while Mr. Baugust has rented the one at the corner of Cannon Street. As time went on the shops were enlarged by extensions at the rear, offices were built and other houses attached. Now these have become old, and in

their turn will give place to better and more imposing property. Of course, from the point of view of the archaeologist, the greatest interest centres in the old-fashioned shop of Messrs. Bach & Barker. The house itself is pretty much the same as it was when originally built nearly 200 years ago. It has become mellowed with age, but it still contains the spiral mahogany staircase and the two circular skylights which were the pride of the household in the days of Dr. Freer and Dr. de Lys.

The whole of the property now belongs to the Rev. Canon Newton, of Redditch, in whose family it has been for more than half a century. It has recently, or at any rate that portion of it which, as stated above, has a frontage to Cannon Street of 144 feet, to New Street 66 feet and to Needless Alley of 164 feet, been let on a lease for ninety-nine years to the Clarence Property Company, Limited, a syndicate which owns a number of central properties in the city. The company propose to demolish the block and to erect several imposing shops, together with offices, &c. at a total cost of at least 20,000*l.* The whole of the work cannot be undertaken forthwith, but at Michaelmas the offices in Cannon Street, the shoeing-forge so long in the occupation of Mr. Parker, and Biglio's restaurant will be handed over to destruction, the shop of Mr. Holroyd, woollen merchant, and the premises of Messrs. Bach & Barker, Messrs. Bostock & Co., and Mr. Baugust being reserved until the New Year. In January next, however, the work will be continued in earnest, and it is expected that the new pile of buildings will be completed in the autumn of 1898. It may be surprising to some people that advantage should not be taken by the authorities to have Cannon Street widened now that the structural alterations are to be carried out, but the public works committee have not interfered in the matter. The building line in Cannon Street and Needless Alley is at present very irregular, and arrangements have been made to make that line as straight as circumstances will permit. In order to do this the Corporation will give up 8 yards of land and the company will sacrifice 18 yards. This will be the means of effecting a considerable modification and improvement in the street line, and though it will not extend the width of the roadway it will enlarge the width of the pavement from a few inches to 2 feet at the narrowest point. The new buildings will be erected in accordance with the plans of Messrs. Essex, Nicol & Goodman, architects, Newhall Street. Provision is made for four shops fronting New Street, to occupy the space of the three original

buildings. They will extend to about half the depth of the site, namely, 80 feet, so that, although the shops will be narrower than those existing, they will be longer and will allow of a greater amount of floor space at the rear. The shops are to include the ground floor, a mezzanine floor, interposed in consequence of the considerable rise of the land up Cannon Street, and first, second and third storeys, the central portion over the two middle shops being continued as an extra storey to form an ornamental gable. In Cannon Street there will also be room for four shops about 70 feet in length, and running through to Needless Alley, but so arranged as to be capable of subdivision, and the portions with frontages to Needless Alley let independently if necessary. Over the shops will be built three floors, which, together with the upper storeys in New Street, will be let for professional and other offices, and approached from a staircase entrance in Cannon Street. The basements, access to which may also be obtained from Cannon Street, are to be so arranged that they, too, may be let apart from the shops. The general style of the design is a free Renaissance, and the treatment will be of an ornate character. Arrangements have already been made for three of the new shops in New Street to be occupied by the present tenants.

THE REBUILDING OF HIGHGATE ARCHWAY.

HIGHGATE ARCHWAY, which in its day was considered a marvel of engineering skill, is soon to be replaced by a handsome span designed by Sir A. R. Binnie, the engineer of the London County Council. When the matter first engaged the attention of the authorities in 1809, says the *City Press*, it was seen that means would have to be found to divert the traffic from Highgate Hill, and various attempts were made at one time or another to render the ascent and descent of the hill less difficult and dangerous. In 1810 Mr. Robert Vazee, an engineer, formulated a scheme which was the first to take a practical shape. He proposed to drive a subterranean arched tunnel, 24 feet in width by 18 feet in height and about 300 yards in length, through the hill, and Parliament gave sanction to an Act for the carrying out of the proposal. Under the Act the promoters were constituted a body politic and corporate, and went by the name of the "Highgate Archway Company," they being empowered to purchase lands, &c., and to raise 40,000*l.*, with power to raise an additional 20,000*l.*, for making and maintaining the road and archway. Operations were

OF

THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered.

Price 12*s.* 6*d.*

Office: 175 Strand, London, W.C.

at once commenced, and the tunnelling proceeded for several months for the most part through a stratum of blue clay. One morning, however, on the arrival of the workmen, it was discovered that the roof and sides of the tunnel for a length of 130 yards had fallen in, no one fortunately being injured. This unlucky circumstance obliged the proprietors to alter their plan, and have recourse to the cutting of an open road in the line of the intended tunnel, and this effort is now represented in the present Archway Road. The total capital raised for the purpose was 103,608*l.*, but for many years no dividends were paid and the tolls were barely sufficient to keep the roadway in repair. After the company had gone into liquidation, however, the investors were unexpectedly recouped by the general rise in the value of certain surplus land in the neighbourhood, and many persons who had come to look upon the script as so much waste paper received a small dividend. The present archway affords the spectator a delightful view of the country. It is about 36 feet high and half as much in width, and is formed of stone, flanked with substantial brickwork, and surmounted by three semi-arches, carrying a bridge wide enough for two carriages. From the topmost point, one is able to see with distinctness practically the whole of the City, and the dome of St. Paul's stands out as a very striking feature. Incidentally it may be remarked that when the collapse of the tunnel took place tremendous excitement was caused in the neighbourhood, and a wag issued a prospectus in which was promulgated a scheme for the removal of the hill entirely by means of a patent slide into the dale behind Caen Wood and the construction of a huge sea-water tank on the spot where Highgate now stands. Bathing machines were to be placed on hire, and it was proposed to erect in the middle of Caen Wood a house of detention for insane surveyors and attorneys. The wag suggested that the miniature sea should be stocked with herrings and sprats, and calculated that the profits arising from the sale of fish and the hiring of the bathing machines would amount annually to about 5,000*l.* To revert to the new scheme, which is the outcome of the fertile brain of Sir A. R. Binnie, the tender of Mr. C. Wall, of Chelsea, for 25,126*l.*, has been accepted, and a period of two and a-half years has been allowed for the execution of the contract. The cost is to be borne by five authorities—the London County Council, the Middlesex County Council, Islington Vestry, Hornsey District Council and the Ecclesiastical Commissioners. The Commissioners have agreed to furnish 1,000*l.*; the Middlesex County Council, Islington Vestry and Hornsey District Council will

contribute 6,500*l.* apiece, and the London County Council will make up the balance. When it is completed the new archway will consist of one handsome span of ornamental ironwork, completely covering the roadway and part of the embankments and retaining walls on either side. Owing to the proximity of the New River Company's reservoir, however, unusual care will have to be taken; but it is satisfactory to know that the foot passenger traffic down Hornsey Lane and over the archway will not be stopped during the progress of the work.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 18606. William Thompson, for "Improvements in bricks."
- 18853. William Burton and Joseph Burton, for "Improvements in the construction of press dies or plates for the manufacture of tiles having undercut recesses."
- 18823. William Thompson Braham, for "Casement or window fastener."
- 18737. Richard Robert Harper, for "An improvement connected with slats or laths or Venetian or louver blinds."
- 18750. Oliver Westlake, for "Improved means and apparatus for painting or otherwise coating Venetian blinds, laths, or slats; applicable also for painting boards, metal strips, and the like, other than blind laths or slats."
- 18455. Charles Henry Mersereau, for "Combined parting-rail and weather-strip for window frames."
- 18631. Henry Watson, for "Improvements in windows with combined sliding and swinging sashes."
- 18829. Abraham Fitton, for "Improvements in and connected with window sashes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.

This magnificent illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

BUILDING AND BUILDERS.

MR. MORHAM, the city superintendent of works, Edinburgh,
has been instructed to obtain tenders for the extension of the
City Chambers to the west so far as the foundations are laid.

THE Lancashire Asylums Board have authorised the plans
committee to accept a tender for the new buildings. Tem-
porary buildings in wood or iron to accommodate 200 patients
are also to be erected on the grounds at Rainhill.

PLANS have been prepared for a nurses' home in connec-
tion with the Leeds Infirmary at Sunny Bank.

THE new Wolverhampton Workhouse is to be erected on
a site at New Cross containing about fifty acres, which will cost
11,000l.

MESSRS. GUEST & SONS have obtained the contract for the
reconstruction and extension of the North Worcester Brewery,
Stourbridge.

THE railway station at Rhyl is to be reconstructed by the
London and North-Western Railway Company.

THE Glasgow Lunacy Board will visit homes attached to
infirmaries before selecting a plan for the nurses' home at
Gartloch Asylum, which is to cost 7,000l.

CARSHALTON PARK, containing about 100 acres, has been
sold to a company, and is shortly to be developed as a building
estate.

PLANS for a hotel containing forty-five bedrooms, assembly-
room, &c., at Wrexham, have been passed by the licensing justices.

THE new workhouse infirmary at Selly Oak, for the King's
Norton Union, designed by Mr. A. Arkell, has cost 600l. per
bed. At the new General Hospital, Birmingham, the cost was
630l. per bed.

THE Liverpool City Council have authorised the library,
museum and arts and technical instruction committee to invite
tenders for the erection of the extension of the Museum
Buildings and new Technical School.

TRADE NOTE.

AMONG the new buildings in which Messrs. Restall & Son's quick-setting Adamantine plaster has been used are the Hôtel Cambria, Aberystwith, the Art Gallery, Reading, and the Leamington and Rugby post offices. Experience throughout England during sixteen years has confirmed the claims of the manufacturers for the material as fireproof as well as damp-resisting.

ELECTRIC NOTES.

THE Court of Session, Edinburgh, including the Parliament Hall, will on the opening of next term have the electric light. Great difficulty was found in adapting the oak timber roof of the hall to hold the forty-eight lamps.

THE new promenade, Colwyn Bay, will be lighted by the aid of electricity, under the direction of Mr. R. Peers.

MESSRS. DAVIS & SOPER, 54 St. Mary Axe, have been appointed the agents to receive tenders for lighting by electricity the streets of Port Elizabeth, Cape Colony.

A FACTORY is to be erected at Brook Green, Hammer-smith, for the Incandescent Electric Lamp Company, at a cost of about 7,000*l.*, from plans by Mr. J. W. Stevens, 21 New Bridge Street, E.C.

ELECTRIC lights are about to be placed in front of St. George's Hall, Liverpool, at a cost of £553.

THE Gloucester City Council are about to apply to the Local Government Board for permission to borrow 50,000*l.* for an electricity supply and destructor works.

THE electric-lighting committee of the Coventry Corporation have modified their proposals. It is now proposed that

the electric lighting of the streets be not proceeded with, thus saving 2,000*l.*, and that a further saving of about 5,000*l.* be effected by only laying cable mains according as the necessity arises in certain directions. The suggested expenditure of 37,900*l.* will therefore be reduced to 31,000*l.*

VARIETIES.

INCANDESCENT burners are found to be so satisfactory when used for street lamps in Manchester, they are to be employed in several other streets. An anti-vibration arrangement adds to the effectiveness.

THE Technical College, Bradford, is likely to become one of the municipal institutions.

THE personal estate of the late Mr. James Stiff, of the London Pottery, Lambeth, has been valued at 19,843*l.* 19*s.* 10*d.*

IT is proposed to expend 258,000*l.* on a culvert to convey the effluent of the Manchester sewage from Davyhulme to an estuary near Walton Lock.

IN Oldbury it is expected that enough money will be obtained to erect a nurses' home as well as a technical school for Jubilee memorials.

A CARGO of pigeons has been sent from Tennessee to New Orleans for shipment to Manchester.

WHILE the bells were being chimed for the evening service at the parish church of St. Mary, Dover, one of the clappers broke and fell on the head of a lad named Wilson, severely injuring him. He was removed to the hospital suffering from concussion of the brain.

THE Bishop of London (Dr. Creighton) has consented to visit Leicester on Tuesday, October 5, in order to open the new Technical and Art School, which is now being completed in the Newarkes at a cost of about 40,000*l.*

AN occurrence, which might easily have been very serious, took place at St. Bartholomew's Hospital recently. A large number of out-patients were waiting outside the main entrance, when a quantity of plaster from the portico underneath which they were standing became detached and fell on their heads. No very serious injuries resulted, however, the worst case being that of a woman whose face was slightly cut. The injury to the portico is now being made good.

THREE puddlers were working in the Phoenix Ironworks at Hamilton, when a large mass of iron which they had taken out

of a furnace at white heat and placed on an anvil suddenly slipped off into the water trough, causing a terrific explosion. Portions of the soft iron struck the men and flew outside the works.

CARISBROOKE CASTLE, which has undergone partial restoration as a memorial of the late Governor of the Isle of Wight, Prince Henry of Battenberg, will be opened to the public shortly.

THE Cambria Hotel at Aberystwith, which has just recently been opened, occupies a commanding position at the western end of the Promenade, opposite the pier, and has been erected from the designs of Messrs. Ewen & J. Alfred Harper, architects, of Birmingham, who have had to overcome many difficulties as regards the site in producing a noble and handsome building. The hotel is built of native stone, in the Renaissance style of architecture. The front elevation is characterised by dignity and beauty, and is relieved by an effective treatment of the entrance and windows, with massive freestone dressings, carved entablature and finely-moulded cornices. When completely finished, the hotel will accommodate a large number of guests. The interior arrangements and the furnishing are of approved modern pattern. The electric light is installed throughout the building; baths are provided on every floor, with a supply of sea water under the control of the visitor, and a hydraulic lift gives easy access to the various floors. The large entrance hall is decorated in a Pompeian style and furnished with luxurious lounges. The drawing-room, dining-room, coffee-room, billiard-room, smoking-room and other apartments are all conveniently situated and arranged and handsomely furnished; while suites of private rooms, with all the necessary conveniences, are provided.

THE new line from the North and the Midlands to London, forming an extension of the erstwhile Manchester, Sheffield and Lincolnshire—now the Great Central Railway—will, it is stated, be opened for passenger traffic not later than June or July next year. The London terminal section of the line, that has swept away so large a part of old Marylebone and St. John's Wood, is in an advanced stage. The covered ways and tunnels are now practically finished from Finchley Road to the bridge over the London and North-Western Railway. Southwards of this point the works are being carried out as speedily as possible. The covered way under Lord's Cricket Ground has been duly and punctually made, in pursuance of an agreement with the Marylebone Cricket Club, under which the

latter have largely increased their area. Active progress is being made with the Grove Road and St. John's Road bridges and with the coal yard. The foundations for the goods warehouses are now nearly all in, and those for the terminal station are in full progress. Contracts have been let for the whole of the building and roofing of the station, and the work is proceeding. This station will be faced in the Marylebone Road by the Hotel Grand Central, which, judging from the plans, promises to prove a palatial building. Wide thoroughfares are in course of formation leading to the railway, and extending from Lisson Grove to Park Road and into Marylebone Road. Turning to the southern division of the railway—that is, a length of 14 miles, extending from north of Rugby to the junction with the Metropolitan Railway at Quainton Road—the earthworks are rapidly approaching completion. Only one viaduct, that at Catesby, remains to be finished, and this is well forward. The bridge crossing the Birmingham and Oxford Canal near Rugby proceeds apace. The brickwork of the Catesby Tunnel—a tunnel 3,000 yards in length—is now completed, and trains will shortly be running through the tunnel. Twenty-five miles of the permanent way (angle line) have been laid.

THE ancient parish church of St. Mary, Gosforth, Cumberland, now undergoing restoration, has proved rich in antiquarian remains. It is not many years since the mythological character of the cross in the churchyard was elucidated. It is believed to be the tallest ancient cross in Britain, and is pronounced "one of the costliest olden roods in Europe." Of red sandstone, elaborately carved with mystic figures in bas-relief, it has withstood the storms of twelve centuries, and is in excellent preservation. The Rev. W. S. Calverley, vicar of Aspatria, made out the carvings on the four sides of the cross to be illustrative of legends in Scandinavian mythology. It is a Christian monument, and not a heathen pillar surmounted by a cross, but it is curious for its representation of Northern myths and Christian doctrines, and for the way in which one bears testimony to the other. One of the sculptures represents the Crucifixion. The remains of three other crosses, apparently of about the same age, have also been found at different times in the churchyard. During the recent alterations two hog-back or coped tombstones, supposed to be a thousand years old, have been found. One was under the foundation of the north wall, built probably in 1125. Another was found at the corner of the nave, forming the foundation of the pillar supporting the chancel arch. The one found in the

Telegraphic Address, "PITTURATO, LONDON."

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

north wall is in two pieces, and is 5 feet 6½ inches long. On one side are carved interlaced ornaments of four patterns, on the other there is a battle scene representing two hostile armies. At the head of one group stands a chief armed with a spear, a circular shield in his right hand; behind him are thirteen warriors, all bearded, and with spears over their shoulders. Opposite stands the chief of the opposing army, holding upright a pole or lance at the top of which is a triangular flag, and behind him also there are thirteen men. The second hog-back is in three pieces, and is 5 feet 1 inch long. It has quite a different character. At the apex there is a rope or twist much worn away, and between the rope is the plaited body of a serpent with the head of a wolf, open-jawed, and like those on Gosforth Cross. It gapes upon and seems to do battle with smaller serpents. In a panel 4 feet long there is a design in bold relief of two wolf-headed serpents in fierce conflict with a human figure, which subjugates or rides upon a smaller serpent, and holds one of its jaws in each hand. Hog-backs, whole or in fragments, exist at Bongate (Appleby), Aspatria, Cross-Canonby and Millom.

It is understood that the War Office asks the sum of 40,000*l.* for the site of the Infantry Barracks, Regent Road, which the Salford Corporation has been urged to acquire for the purposes of a recreation ground. The area of the site is 50,000 square yards.

THE David Lewis trustees have handed over to the Corporation of Manchester 19 acres of land at Blackley to be used as a recreation ground for children. The ground cost 8,000*l.*, and the laying of it out a similar sum. The whole expense has been borne by the trustees. A similar gift was also made to the Salford Corporation, the trustees presenting 25 acres of ground at Peel Park to be used for the recreation of children. The land cost 10,000*l.*, and the levelling, &c., 5,750*l.*

THE EMPIRE THEATRE.

THE management of the Empire certainly deserve the very ample support which is bestowed upon them by an appreciative public, for whenever one drops in at that essentially comfortable place of entertainment one may rely on having a thoroughly amusing and interesting evening, without being called upon to witness or hear anything calculated to heighten the colour in

the "cheek of the young person." Just now the bill is especially strong, comprising as it does the beautiful garden scene from the successful ballet "Monte Christo," and the Jubilee *divertissement* "Under One Flag," which, essentially a *pièce de circonstance*, is nevertheless bright and graceful, full of pretty grouping, colour and tuneful music, while its eminently patriotic tendency is highly appreciated. R. G. Knowles, whose witticisms and quaint humour have firmly established him in the affections of the public, is here, and excites continued laughter from his entrance to his exit. Prella, the ventriloquist, who ventriloquises through the medium of trained dogs, gives a very diverting turn. Miss Ada Colley, whose upper notes are simply phenomenal, has an artistic method, and wins abundant applause. Our old friend Cinquevalli seems to continually add to his repertory and to his dexterity, and the same may be said of Schäffer. Other good items of the lengthy bill include Miss Marion Lewis, vocalist, Pottinger's excellent Swedish Sextette, Paul Batty and his performing bears, the Paolis, and the realistic Cinématographic views of the Jubilee Procession and the Spithead Review.

FORESTRY IN INDIA.

IN early times the greater part of India was covered with forest, but the land not cleared for cultivation was, for the most part, denuded by over-cutting and over-grazing with burning. If denudation has not affected the climate generally, it has without doubt resulted in the drying up of springs and streams rising within the areas deprived of the shelter of a crop of trees; and this is a serious matter in connection with the question of irrigation by canals led from rivers which are not snowed, as well as in localities where damage has resulted from the formation of ravines and torrents. The permanence of the supply of timber and other forest produce for the use of the native population and for State purposes has also been endangered.

When the Government wished to take action its powers were found to be uncertain, for the destructive usages of the people had come to be regarded as inalienable rights; and it was necessary to pass a special Forest Law, which, among other things, provided for the formation of reserved forests, after a full inquiry had been made into claims, and for the regulation of proved rights within limits which would not

EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,
LONDON. N.W.

endanger the permanent maintenance of the forests. The work of "settlement" is now approaching completion in several provinces.

In order to secure the forests from over-felling, and to insure that all work done may tend towards the production of the largest quantity of wood of the kind most desired, working plans are a necessity, and considerable progress has been made in their preparation. During the dry weather the forests become extremely inflammable, and vast areas have been annually burnt over from time immemorial, with the result that the crop is reduced to the poorest possible condition, or entirely destroyed. Measures have been taken to meet this great evil, and large areas are now successfully protected.

The controlling staff of the Forest Department is trained in England, but the cand dates follow a course of practical instruction in continenta State forests. The native executive officers are trained at the Imperial Forest School at Dehra Dun. What has been done could not have been accomplished by private enterprise. The Government has set an example which has been followed by several of the more important native States. Much more remains to be done, but forest conservancy in India has reached a stage at which its steady progress cannot be arrested.

THE METROPOLITAN BUILDING ACT.

THE report of the London County Council states that the Building Act committee have had to decide upon their procedure with regard to dangerous structures. The practice followed for many years has been that, upon receipt of information as to a structure considered dangerous, the architect has instructed the district surveyor to survey and certify as to the structure; and, upon receipt of his certificate, notice has been served upon the owner requiring the execution of such works as the district surveyor may consider necessary, proceedings being taken before a police magistrate in the event of the notice not being complied with. In dealing with a case in which a summons had been taken out against the owner of a dangerous structure for the recovery of expenses incurred, the magistrate dismissed the summons, taking the view that the words in section 103 (1) of the London Building Act, "where it is made known to the Council that any structure is in a dangerous state, the Council shall require a survey of such structure to be made, &c.," imply that the Council has itself to consider

each intimation that a structure is dangerous, to authorise a requisition to the district surveyor, and service of notice on the owner, and, in the event of non-compliance with the notice, to authorise proceedings. This ruling of the magistrate, if correct, would have involved an entire change in the practice hitherto prevailing, and a mass of detail work would be brought before the Council which, in its opinion, was not the intention of the Legislature. The Council, therefore, submitted the point for the decision of the High Court, and on December 10 the decision of the magistrate was reversed, and the case was sent back to him to be heard on the facts. The judges expressed the opinion that the course hitherto taken was in accordance with the Act, and that the exercise of powers compulsorily placed upon the Council must be undertaken by its properly authorised representatives without waiting for direct instructions from the Council itself in each case. Applications were received for approval of 77 plans for the formation of new streets, of which 44 were granted. For consent to the erection of buildings at less than the prescribed distance from the centre of the road 152 applications were received, of which 76 were granted and the same number refused. The total length of the new streets sanctioned by the Council is about 8½ miles, and they have received 351 applications for the erection of buildings beyond the general line of frontage in the street, of which 177 were granted. For the construction of porticoes, balconies and verandahs 142 applications were received, of which 114 were granted and twenty-eight refused. This committee has also taken in hand the question of street nomenclature—no inconsiderable task—and their labours in this direction have been heavy. No fewer than 4,032 cases of dangerous structures, the result of fires and other causes, have been reported during the year. This committee is also called upon to deal with matters arising under the Factory and Workshop Acts, 1878 to 1895, but, so far as possible, it endeavours to avoid unnecessary interference with the trade or manufacture carried on at the premises, and due consideration is always given to representations made by the owners as to this and other matters. As many as 165 factories have been inspected, and in sixty-five cases the owners were required to carry out alterations for facilitating the escape, in case of fire, of the people employed, and in several of those cases the works are in progress. Drawings of thirty-three new factories were submitted, with the view of satisfying the Council that sufficient means of escape therefrom would be provided; and in each of those cases it was determined that a certificate should be issued on the completion

With top centre
and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required. The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down. It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT, E.C.
Architects and Buyers are respectfully invited to inspect same.

of the building in accordance with the deposited drawings. Sky-signs are reported to be fast disappearing—in fact, the majority of the licenses expire next month. The Tribunal of Appeal, which was constituted under section 175 of the London Building Act, 1894, has, during the two years ended December 30, 1896, heard sixteen appeals, nine in the first year and seven in the second.

THE FREE LIBRARY, CAMPBELTOWN.

THE memorial-stone of the new library and museum which when completed will have cost, it is anticipated, between 8,000*l.* and 10,000*l.*, and will be a very handsome edifice, was laid on the 25th ult. by the Duke of Argyll. One of the conditions of the gift was that the Free Libraries Act should be adopted; and a resolution to this effect was adopted by the Town Council with the hearty approval of the ratepayers. The building is L-shaped, and has a frontage in Shore Street to the bay of 93 feet, and to St. John Street of 137 feet. The enclosed ground open to Shore Street is laid out as a garden to form an adjunct to the museum for the exhibition of archaeological and other exhibits not requiring cover. Internally the buildings are divided into a library or bookstore, 47 feet by 24 feet, capable of containing over 10,000 volumes; a ladies' reading-room, 24 feet by 18 feet; a general reading-room, 37 feet by 24 feet; a museum or picture gallery, 48 feet by 24 feet; and a general hall or news-room, 36 feet by 19 feet. This latter is the general vestibule, and gives independent access to each department; divided from the ladies' and general reading-room on either side, and from the library at one end by stone arches filled in with screens of timber and glass, it is covered with a lofty, open timber roof, the floor being of tilework and the upper walls of rough plaster. It forms the memorial hall of the building, and it was here, immediately behind the main entrance, that the memorial-stone was laid, and it will remain a prominent feature at the opposite end of the interior. In the library or book-store the finish is of the simplest. The book-stacks are in the centre of the floor, clear of all inside walls, and everything is done to reduce the harbour for dust and the risk of damp. The ladies' room, which occupies the corner of the site, and the octagonal side of which forms the main decorative feature of the front to the bay, though not ornate, is of richer treatment. The lower walls are lined with wood, and the ceiling is carved and moulded in plaster. The general reading-room, of which the

three oriel windows form, with the main entrance door, the principal feature of the St. John Street front, is panelled in the same way as the ladies' room, but the plaster ceiling in this case is supported by heavy wood beams. The museum or picture gallery is lighted primarily from the roof. Small side windows, which may be covered when the room is used as a picture gallery, give opportunities of suitably lighting cases containing the smaller exhibits which depend for their interest on closer inspection. Though entered through the general reading-room, the museum has an independent access from the hall through a covered way or cloister passing along one side of the garden, and it is intended that the centre of this cloister should also be used for exhibition purposes. Externally the details of the building are simple and effective; in style the work may be said to be Early Scottish Renaissance, but there is no attempt at any symmetrical architectural treatment. The different purposes of each room give character to its external appearance. The desired result is a building not interesting in itself, but one which will form a quiet retreat, and which may encourage the study of the books and antiquities which it contains. The building is from designs by Mr. J. J. Burnet, A.R.S.A., Glasgow, under whose supervision the whole of the work is being carried out.

WOOD PAVING IN LONDON.

THE Paddington Vestry has applied to the London County Council for a loan of over 12,000*l.*, to admit of extended road paving with hard Australian wood, instead of the Swedish deal blocks hitherto used, the former, though the initial cost is greater, being found more economical in the long run, on account of greater durability. It is besides, according to a report of the vestry's investigating committee, more cleanly and sanitary. The absorbing defects of soft wood, from which the hard is free, have led to complaints of bad smells, and in Marylebone, where deal has been extensively used, Dr. A. Wynter-blyth, the medical officer of health, has sought to counteract the disagreeable effluvia noticeable at times by pouring an acidified solution of sodic manganate on the road. St. Pancras, as well as Paddington, has discontinued the use of soft deal altogether, in favour of the West Australian hard wood. The special committee of the Paddington Vestry, who have thoroughly investigated the relative merits of hard and soft woods as road-making material, state that if the life of hard

wood as against that of soft wood be estimated by its wear, they consider that at least fifteen years may be taken for hard wood against a life of six years for soft wood, on roads subject to heavy traffic. Assuming the average life of the present soft wood now laid down in Paddington to be seven years, its renewal necessitates an estimated yearly expenditure of 8,750*l.* Allowing the hard wood a life of twelve years only, the yearly renewals would cost 8,070*l.*, showing a saving of 680*l.* per annum. A longer life would show a larger saving. The committee add that there is no doubt that on roads with heavy traffic the saving would be very great. The London County Council, who fully recognise the economy of hard wood roads, will, for renewals of such material, grant a loan for seven years.

THE LONDON BUILDING ACT.

A CASE of some interest under Section 74 was recently decided by Mr. Hannay at the Marlborough Street Police Court in connection with the rebuilding of the Rising Sun Tavern, situate at the corner of Windmill Street and Tottenham Court Road. The whole of the ground storey was arranged as a bar, entered from both streets, and the first storey, all except the staircases, constituted a large billiard-room. The plans showed a single staircase, approached from the bar, leading to the first storey; and the landing was separated from the billiard-room by an enclosure, which was proposed to be of brickwork 4½ inches thick, with a door to the billiard-room, having glass panels. From this landing, but separated both from the billiard-room and from the staircase last mentioned by a 9-inch wall, a staircase led up to the upper storeys, which were to be used as sleeping rooms for the staff, &c.

The district surveyor (Mr. F. Wallen) served notice of objection on the builders, and the owner appealed in their name from such notice to the magistrate. The notice of objection of the district surveyor was to the effect that the building would exceed 10 squares in area, and would be used partly for trade purposes and partly as a dwelling, and that these two parts were not separated, in accordance with Section 74, by walls and floors of fire-resisting materials, inasmuch as there would be a common staircase belonging to both parts of the building entered from the bar, and without any separation from either part; and also that the enclosure on the first storey, being only 4½ inches thick, and having a door with glass panels, was not a proper wall of fire-resisting materials between the staircase

and landing leading to the dwelling on the one hand and the billiard-room on the other.

For the appellant it was contended that the enclosure of the staircase up to the one-pair storey and of the landing on that storey, so as to separate the ground-floor stairs from the billiard-room, was not prescribed by Section 74; but that it was sufficient to have a staircase starting from the billiard-room upwards, enclosed with a brick wall and a fire-resisting door.

In support of the district surveyor's notice of objection it was argued that such a construction as the builder proposed did not satisfy the section, which in effect required the approach to the dwelling-house portion to be entirely separated from the trade portion; that the section, though clumsily worded, effected this object by saying that "all means of approach to the dwelling-house portion should be constructed throughout of fire-resisting material;" that in this case the dwelling-house portion could not be approached except by coming through the bar either from one street or the other to the staircase, and that the bar itself was therefore a means of approach to the dwelling-house portion, and that inasmuch as the bar would presumably have glass windows and doors, &c., in it, it could not be constructed throughout of fire-resisting materials, and so must not be used as an approach to the dwelling-house portion. To comply with the section it was necessary, as the district surveyor required, to make a separate approach entirely walled off from the bar by a 9-inch wall leading from one of the streets to the staircase, and also to separate the billiard-room from the staircase by a similar wall, since in no other way could the builder provide the dwelling-house with an approach which would be fire-resisting throughout. It was pointed out that such an approach could be readily made from Windmill Street.

Mr. Hannay said that the construction proposed by the builder would produce the very evil that the clause appeared intended to prevent, viz. that in case of fire in the trade part of the building persons in the dwelling-house part would have to rush through the flames to get out of the building. In this case the bar was being used as an approach to the living-rooms, and the bar could not be made fire-resisting throughout. He accordingly upheld the requirement of the district surveyor.

In this case Messrs. Treadwell & Martin, the architects of the building, arranged that the objectionable practice of "summoning the district surveyor" was not taken, but the more proper mode of obtaining an appointment for the magistrate to hear the case and giving the district surveyor notice of

it was adopted. In a matter like the present, arising on notice of objection under Section 150, nothing in the section warrants any summons being issued to either party.

PENALTIES IN CONTRACTS.

At the meeting of the Glasgow Corporation Police Department on August 23 the subject of the Ruchill Hospital contract was considered. The Clerk reported that, as instructed, he intimated to Messrs. Morrison & Mason, Limited, contractors, that the Corporation would hold them liable for, and insist on payment of, the penalty of 10*l.* per day, in terms of the contract for the work of the hospital since 1st ult., when the work should have been completed, till its completion, and he submitted a letter of date August 10 received by him from that firm to the following effect:—"We beg to state that the time for the completion of the works is not yet due, and therefore the penalty cannot be put in force meantime. Independent of other causes entitling consideration under the contract, we are entitled to an extension of time equal to that during which we were not allowed to proceed with the work in consequence of frost and bad weather. Under these circumstances, and in terms of the contract, it now falls to your engineer to certify the period: o which, in his opinion, the completion of the contract should be extended, and the Corporation to extend the time accordingly." The Clerk further reported that on receipt of that letter from the contractors he forthwith communicated with the city engineer, who in a letter to him of August 13 reported as follows:—"I beg to inform you that I did not at any time intervene personally, but I find from the notes kept by the clerk of works that in the two years from July 1895 to July 1897 there were 107 days on which work was discontinued from stress of weather." The Clerk further reported that under the contract between the Corporation and the contractors, which was signed by the contractors on June 5, 1895, and by the Corporation on July 1 thereafter, it is, *inter alia*, provided that the "works shall be completed within two years from the date hereof—declaring that in the event of the said works not being completed within the said period the contractors shall pay to the first party (the Corporation) a sum of 10*l.* in name of liquidated and ascertained compensation in respect of each day or part of a day during which the work is not completed . . . declaring further that if the work, or any part of it, may from time to time be suspended

during frost or bad weather at the discretion of the engineer, and by strikes of workmen, and in such cases the engineer shall certify the period to which, in his opinion, the completion of the contract should be extended, and the first party (the Corporation) shall extend the same accordingly." After discussion the sub-committee agreed to report the foregoing to the sub-committee on hospitals and the health committee. At the meeting of the health committee the minute of the hospitals committee was considered and discussed, and having heard the clerk and the city engineer thereon, and having regard to the terms of the contract between the Corporation and Messrs. Morrison & Mason, Limited, and in respect of the certificate by the city engineer, of date August 13, that the period to which, in his opinion, the completion of the contract should be extended in respect of frost or bad weather is 107 days, being the number of days on which work under the contract was, with the acquiescence and approval of the clerk of works, discontinued in respect of frost or bad weather, agreed to recommend that the Corporation extend the period of the completion of the contract to 107 working days, as from June 30 last—River-Bailie W. F. Anderson and Councillor J. Willock dissenting.

Mr. Murdoch moved the approval of the minutes.

Mr. Steele seconded.

Mr. Willock drew the attention of the Council to the minute, and stated that at last meeting the Council agreed to impose a penalty of 10*l.* per day for the period beyond the two years when the contract should have been completed. And now they found the engineer reporting that the contractors had 107 days still within which to finish their contract. It was a stupid position in which the committee had been placed, and they were apt to be told that Messrs. Morrison & Mason had got the better of the hospitals committee. He asked a month ago if the contractors had notified that the works had been stopped for any time owing to frost or stress of weather. The engineer then reported that no such document had passed. He was not against Messrs. Morrison & Mason, but there had been a grave irregularity, which reflected on the committee, and he was not going to allow this to pass or take blame for this unfortunate state of matters. He considered the contractors, so far as he knew, had done their work well, but apart from that this was a question of contract.

Mr. Cronin moved that the minute be taken back for further consideration.

Mr. John Ferguson seconded.

Bailie Robert Anderson said if the clerk of works had stopped

the work at Ruchill in the interest of the Corporation, surely it was right that the contractors should get the benefit of the time the work was so stopped.

Dr. Carswell said that, looking at the terms of the contract, there was no doubt that Messrs. Morrison & Mason were entitled to be relieved of this penalty; but as a protest against the concealment which had been practised he would support the amendment.

Mr. Steele said that it was true that most of the committee were not aware of the terms of the contract, and there would be no use in sending back the minute.

Mr. Maxwell asked whether the other contractors who declined to accept the contract were aware that this clause was in the specification.

Treasurer Colquhoun asked why Mr. Macdonald and the clerk intimated that a penalty had been incurred when it was the case that 107 days' grace had to elapse.

Mr. Lindsay, the clerk, in reply to Mr. Maxwell's question, stated that the negotiations with other contractors were never so far matured as to permit of a similar clause being inserted. To the question of the treasurer he replied that he reported to the committee that the time allowed for the contract had expired, provided none of the contingencies mentioned in the report had arisen. The committee, notwithstanding, directed that the report should be printed as it appeared in the minutes.

Mr. Macdonald, the engineer, said he reported verbally to the committee that it was the case the weather had interfered with the work, and that it was a matter for their consideration whether they should enforce the penalty. But that report, like the report of the clerk, was swept aside.

Treasurer Colquhoun said it appeared to him that the Corporation had been put in an exceedingly foolish position in intimating that the penalty had been incurred. They ought to have known that there were days of grace still at the disposal of the contractors. This ought to be a lesson to the clerk of police, the city engineer and the health committee to be more careful in their future communications with Messrs. Morrison & Mason.

Bailie Battersby thought that without blaming anybody they ought to accept the inevitable and get the hospital finished as quickly as possible.

Mr. Steele said the work was almost finished, so far as the contract was concerned.

On a division the minutes were approved by thirty-four to eleven for the amendment.

RECENT DEVELOPMENTS IN SEWAGE PURIFICATION.*

It may be thought that the term "recent" as applied to sewage purification is a scarcely necessary qualification. Sanitary work taken altogether does not go back to a very remote antiquity, and sewage purification is one of its later developments. But although we might truthfully say that all developments in this direction are modern in the extreme, such expressions are of necessity comparative, and already many processes from which much was expected have entirely disappeared or only remain embalmed in what we may call the ancient history of sanitary progress. Beginning from the time when all refuse matters were simply poured or thrown into the watercourses, the first stage in our progress was the endeavour to enrich the land by means of sewage, either by running it over the surface or by allowing it to deposit its solid matters in tanks, in the belief that the solid deposit would be most valuable manure, while the upper liquid would be practically pure. But while the direct application of sewage to land has often given excellent results, the simple process of settling was a failure, because much of the impurity was dissolved and therefore did not settle to the bottom. Next in order came the various processes which aimed at effecting this separation by the addition of some substance which would cause precipitation, and fortunes were hoped for from the manures thus to be produced. Although time and again the same result was reached—a sludge of little manurial value and an effluent far from pure—these early experiments left us with a number of precipitation processes which, with the addition of filtration, could produce a reasonably good effluent, and left us, too, the knowledge that treatment on land could produce an effluent which satisfied our requirements. Apart from developments in detail, one of the most interesting features in regard to sewage purification is the way in which science has been pressed into the service. Beginning, to all appearance, as a process which merely required some very ordinary structural arrangements for its efficient carrying out, it was not long until the resources of chemistry were largely drawn upon, and now it looks as if both the engineer and the chemist would have to occupy a position altogether subsidiary to that occupied by the omnipresent microbe, and that their operations must be directed by those to whom the habits and life history of the microbe are best

The FINEST EXAMPLES.

known. While, however, it would appear as if the future progress in sewage purification would be largely dependent on bacteriological research, the new methods have not yet so completely proved their superiority as to drive the others out of the field. There are still many competing systems full of vitality, and my object is not to advocate one or another, but to show the main lines on which recent advances have been made. In considering the different principles on which purification may depend, it is well to bear in mind that no system removes the impurity in the same sense as a bale of goods is removed from a cart. To a certain extent this may be done, but there is inevitably a considerable part which it is impossible to remove, and which at best can be made harmless. In these circumstances it is, of course, quite open to consideration whether it is worth while to remove any, except perhaps by mechanical straining.

At the present time there are three chief methods of treatment—on land, by precipitation and by bacteriological methods. In the first and last of these would be combined a strictly scientific classification, but there is sufficient practical difference to warrant us in making a distinction. It may be said, indeed, that the chief development in connection with land treatment is the discovery that the purification is effected by living agencies. From the purification point of view the effect of the crop is not of great importance, whatever it may be financially. The system of land treatment still holds its own, but it is doubtful whether it will continue to do so, as there are greater chances of improvement in connection with the newer methods. It is in connection with the precipitation methods that mechanical ingenuity has had most scope. In all of these the general features are similar. A quantity of some precipitant is added to the sewage, which is then run into settling tanks so that the sludge may settle. In recent times improvements have been made in the design of the tanks so as to produce the maximum precipitating effect in the methods of removing the sludge from the tanks and in the subsequent treatment of the sludge. As to the first of these, the Cosham tank may be given as an example. The ordinary tank is rectangular or occasionally circular in shape, and the bottom is nearly or altogether flat, while the sewage either passes from one tank to another over a simple system of division walls, or remains quiescent in the tank which it first enters. The Cosham tank, on the other hand, consists of a number of cells and the sewage passes from one to another through what are called "floculent flues." At Nuneaton, which is said to produce the foulest

sewage in England, excellent results are obtained, and there was a marked contrast between the stream of exceedingly foul sewage entering the works and the effluent which entered the small stream and which appeared to contribute to its purity rather than to its pollution. Those in charge of the Nuneaton works put much more stress on the construction of the tanks than on the particular substance used as a precipitant, and they believe that their present success, after a number of failures, is due to the working of the floculent flues. The disposal of the sludge is one of the serious difficulties in precipitation works. In its raw state it can scarcely be disposed of even for nothing, and any treatment involves cost. The method adopted in Glasgow, of drying it sufficiently to form a fairly portable manure, gives a prospect of some return.

The processes which meantime are attracting most attention are those which produce no sludge, or, in other words, which go on the principle of decomposing and reducing to harmless forms all the substances contained in the sewage. They recognise the fact that these changes are associated with the life of certain minute organisms, and they therefore endeavour to have the changes carried out as speedily as possible, by providing conditions suitable to the activity of these organisms. Two developments of this idea have been brought somewhat prominently before us of late—the bacteriological filter and the septic tank. These both depend on the action of the microbes which live on sewage; but they differ in this respect, that while the bacteriological filters depend on one class of these microbes—those which require air or oxygen for their support—the septic tank depends on the so-called anaerobic microbes—those which want no air—and it is only when they have done their best with the sewage that it is handed over to the tender mercies of their aerobic brethren in the filters. The septic tank, in other words, is really a preliminary to passing the sewage through a form of bacteriological filters. The principle of the bacteriological filters is a perfectly simple one. Resembling somewhat an ordinary filter turned upside down, they are so constructed as to allow the sewage to penetrate into them and also to allow air to have free access throughout the mass. Beginning with little or no power of purification, the filter gradually rears, as it were, a colony of microbes, which is supplied with suitable food in the shape of sewage, and which literally eats the sewage that is turned into the filter. The reversal of the ordinary construction of the filter is for the purpose of avoiding the coating over of the surface, and the consequent exclusion of air which would result if the

filter were constructed with fine material at the top. The whole construction is simply a concentrated land filter, with the soil replaced by another material—coke, coke-breeze and the like—suitable for lodging the microbes. The septic tank process is a little more elaborate. When the sewage has entered the tank it is excluded from light and air. The heavier suspended matter falls to the bottom, the lighter rises to the top. The anaerobic microbes which have gradually developed in the tank, the condition being favourable for their existence, attack the sewage microbe, and by their aid putrefaction takes place with considerable rapidity. After taking about twenty-four hours to pass through the tank the sewage reaches the outlet, is run over aerating troughs, and is finally filtered. The anaerobic microbes which are unfortunate enough to pass out with the sewage are killed by the air, and the filter, being already stocked with those which flourish in air, has a clear field to work on. I visited the Exeter works in the early part of this year, one of the chief objects being to see whether such a mode of treatment could be carried out without any outward indication of the exceedingly offensive process going on in the tank. The works proved to be quite as inoffensive as a well-managed sewage works usually is. An ingenious mechanical arrangement is in use, by which the stream of sewage was automatically turned on to filter after filter, but it seemed to me not unlikely that by some modifications in the filtering arrangements a more uniform effluent might be produced.

That we have not yet reached a final settlement of the sewage question is proved by the fact that within the last few weeks we have seen by the newspaper reports that works on each of the three leading methods referred to have been adopted or recommended. This is, of course, so far due to the differences in local conditions, but it suggests also the probability that meantime there is so little to choose between the best representatives of the various systems that causes more or less accidental may be sufficient to turn the scale in favour of any of them.

LAUNDRY MACHINERY AND MOTOR CAR EXHIBITION.

At the exhibition now on at the Agricultural Hall, to which we were able to refer only very briefly in our last issue, many of the exhibits in the laundry section possess very considerable interest, and principal among these we may mention those of Messrs. Macintosh, Meikle & Co., Limited, 52 Queen Victoria

Street, E.C., who are showing a pressure-washing machine of 275 shirts capacity and one of 200 shirts capacity. In these machines the outer casing is constructed of steel boiler plates, and the interior cylinder of hard-rolled perforated brass sheets; the inner cylinder has brass sliding doors with brass lifters, the door openings being made the largest size possible compatible with safety; the outer doors are also of the largest size possible, and are so constructed as to be steam-tight and to be opened and shut with the greatest facility. The perforations in the inner cylinder are embossed by a special process, so that no metallic raw edges are left to come into contact with the clothes and so damage them during the washing operations. The gearing is automatic in action and simple in construction, and it is so arranged that, in the event of the clutch or lever not being properly fastened into position, the machine automatically stops itself by the time one revolution is completed. The machines are fitted with safety-valves, which are set to blow off at about 10 lbs. pressure per square inch. These two machines are a novelty from the manner in which they are driven.

A patent water-motor is employed for the purpose; no belts are necessary, and the machines can be placed entirely irrespective of existing shafting, and complete access is given all round the machines. One non-pressure washing machine, 275 shirt capacity, and one non-pressure washing machine of 200 shirt capacity driven by belting from the main shaft are also shown. These are built of metal similarly to the above, but are not constructed to withstand steam pressure. The doors in these machines are built of the full width of the cylinder. In both classes of machine hand-turning gear is fixed, in order that the inner cylinder may be brought into position with the opening in the outer drum; upon the openings being brought into line the machine automatically locks itself. These, and the previous machines, are made in all sizes, with capacities varying from 100 to 250 shirts. One four-roller ironing machine, with all latest improvements, is also shown, driven by the above-mentioned patent water-motor, whereby the machine can be placed in any position irrespective of existing shafting, thus permitting complete access all round the machine, and it also avoids the protecting of belts. The improved Decoudun ironing and finishing machine, with cylinder 108 inches and 2 feet in diameter, driven by belt, is constructed to give a high finish and perfect drying in one passage through the machine. The new pattern body ironer, with rollers having parallel motion, is exhibited for the first time.

THE WELL-KNOWN FRIEZE, ENTITLED

"THE CORN FIELD."

| 5. The Products of the Corn Field. | |

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

**A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.**

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

Messrs. Watson, Laidlaw & Co., 98 Dundas Street South, Glasgow, have a large and varied assortment of hydro-extractors or centrifugal machines. The machines are all of the "Weston" or "self-balancing" type, and embody several important improvements on the original "Weston." The types exhibited do not exhaust all the possible forms of hydro-extractors, and are only illustrative of those types which have found most favour amongst laundrymen. Four methods of driving these machines are shown, namely, by steam-engines on the machine, by main belting, by hand-power and by water-power. Every size of machine made by this firm can be driven by steam, belt, or water, and the smallest sizes by any of the four mentioned methods. These extractors require no expensive foundations and the oiling arrangement is a special feature in their construction, all bearings being on the self-oiling principle; the dropping of oil on the contents of the machine, therefore, is rendered impossible. No. 1 is a 48-inch suspended hydro-extractor driven by a steam engine fitted to the frame of the machine. The engine does not drive direct, but the power is transmitted by means of a belt, thus permitting the running of the engine at a moderate speed and effecting considerable saving of steam. Nos. 2 and 3 show two suspended hydro-extractors for belt-driving. No. 2 is a 36-inch suspended machine, and is one of the most handy and the most suitable size of machine for general purposes in laundries. No. 3 is a 24-inch suspended hydro-extractor, which, although it is shown arranged for belt-driving, can also be supplied fitted with a small engine instead of the belt-gear. No. 4 shows the kind of basket which is utilised when chemical or granular substances are to be dried; it is fitted with a valve in the centre, which allows the dried contents to be emptied through the bottom of the cage into any convenient receptacle. These baskets can be fitted to any of the suspended machines. No. 5 consists of two sizes of hand-power hydro-extractors. These machines are eminently suited to the requirements of the proprietors of smaller laundries who may be desirous of purchasing high-class machinery for their establishments. The small size is 12 inches in diameter and the large size has a diameter of 18 inches. No. 6 consists of two sizes of oil-extracting machines used for extracting the oil from iron and other turnings; by its use a large saving in oil is effected. These machines can also be utilised to get the bulk of oil out of oily cotton and other wastes, and in places where oily rags are washed it saves a very large quantity of benzine. No. 7 shows a 36-inch pivot hydro-

extractor for belt-driving. This new form of extractor is very popular in laundries, dyeworks, &c., for the reason that it occupies very little space, and is entirely self-contained. No. 8 is a 27-inch pivot hydro-extractor of the same type as No. 7; it is suitable to be driven by belting or by a small steam-engine at the side; if desired the engine will be supplied instead of the belt-gear. Nos. 9, 10 and 11 are other specimens of circular machines. Other of the firm's specialties comprise steel disc pulleys for belts and ropes, a self-oiling swing bearing, &c.

Messrs. Doulton have a stand at which they are showing their well-known white enamelled and cane-glazed ware in wash-tubs, either single or in ranges, lavatories, &c.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

18948. John Thomas, for "Improvements in bolts or locks for doors and the like."

19015. William Edward Ison, for "Improvements in sash-fasteners."

19025. Herman Priester, for "Improved apparatus for closing doors."

19038. Frank Hewlett, for "Improvements in lock nuts."

19106. George Vincent Maxted and Christopher McDermott, for "Improvements in mould-sanding machines, more particularly for use in the manufacture of bricks."

19298. John Rule and Emma Butson, for "Improvements relating to the preparation of mosaic slabs or tiles, and in the foundations or backings for same."

19302. Mark Glover Malpas, for "Improvements in kilns or ovens for firing potter's ware, bricks, tiles and such like, and for calcining various substances."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from 1¹/₂ in. to 6 in. wide. Strands from 24 B.W.G. to 3¹/₂ in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

THE Architect and Contract Reporter.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BATTERSEA.—Sept. 22.—The Vestry of St. Mary offer premiums of 100l., 50l. and 25l. for the three best designs for the erection of public baths and washhouses. Mr. W. M. Wilkins, Municipal Buildings, Lavender Hill, S.W.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500l., 300l. and 200l. respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

CARLISLE.—The School Board offer premiums of 20l. and 10l. for designs for school to accommodate 550 boys. Mr. S. Cartmell, 27 Lowther Street, Carlisle.

DORKING.—Oct. 13.—Plans and estimates are invited for the erection of an infirmary. Mr. George Scales, clerk to the Guardians, High Street, Dorking.

FRINTON-ON-SEA.—Sept. 24.—The School Board invite designs for school to accommodate 150 children and allow of a future extension for 300 children. Mr. A. R. Chamberlayne, Station Road, Clacton-on-Sea.

LEEDS.—Oct. 8.—The Corporation offer premiums of 100l., 50l. and 25l. for the three best designs for a wholesale dead-meat market and abattoir. City engineer, Municipal Buildings, Leeds.

LOWER BEBINGTON.—Oct. 1.—The Lower Bebington Urban District Council offer premiums of 50l., 35l. and 20l. for

the three best designs for a scheme of sewerage for that portion of their district now being drained into the Bromborough Pool. Mr. Thomas Sproat, 5 Castle Street, Liverpool.

LUDLOW.—Oct. 1.—The Corporation offer a premium of 20l. for the best and most economical scheme of electric lighting for the borough. Mr. John Herbert Williams, town clerk, Ludlow.

MERTHYR TYDFIL.—Sept. 30.—The School Board offer a prize of 10l. for the best plan of erecting a second floor to the infants' school. Mr. E. Stephens, School Board offices, Merthyr Tydfil.

MORECAMBE.—Oct. 1.—The Urban District Council offer a premium of 100l. for the best scheme of an improved and extended sewerage system. Mr. Jno. Bond, surveyor, Morecambe.

SKIPTON.—Sept. 30.—The Skipton and District Cottage Hospital committee offer premiums of 15l. and 5l. for the best designs for a cottage hospital, at a cost of 2,500l. Mr. W. H. Dawson, hon. sec., Skipton.

UXBRIDGE.—Oct. 30.—The Uxbridge Rural District Council invite plans for a scheme of sewerage and sewage disposal. Mr. Charles Woodbridge, 38 High Street, Uxbridge.

CONTRACTS OPEN.

ACCRINGTON.—Sept. 15.—For constructing filter beds, covered reservoir, engine and boiler-houses, &c. [Mr. A. H. Aitken, Town Hall, Accrington.

ACCRINGTON.—Sept. 14.—For building business premises. Messrs. Sames & Green, architects, 65 Northgate, Blackburn.

ACTON.—Sept. 23.—For additions to Board school. Mr. Edward Monson, architect, Acton Vale, W.

ALFORD.—Sept. 14.—For rebuilding house. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

ARUNDEL.—Sept. 20.—For building labourers' cottages on the Duke of Norfolk's estate. Mr. Heveningham, Estate Building Office, Arundel.

AULT HUCKNALL.—Sept. 24.—For building school, &c. Messrs. Rollinson & Sons, architects, 13 Corporation Street, Chesterfield.

AYLESBURY.—Sept. 15.—For building retaining walls. Mr. J. H. Bradford, 2 Rickford's Hill, Aylesbury.

BARNSELY.—Sept. 15.—For alterations to business premises. Mr. H. Crawshaw, architect, 13 Regent Street, Barnsley.

BASFORD.—Sept. 20.—For construction and maintenance of stoneware pipe sewers. Mr. H. Walker, Newcastle Chambers, Nottingham.

BASINGSTOKE.—Sept. 13.—For completion of partially constructed wall, &c. Mr. Henry Ross, 8 Victoria Street, Westminster.

BATLEY.—Sept. 15.—For building cottages. Mr. W. Hantock, architect, Branch Road, Batley.

BEAUMARIS.—Sept. 13.—For additions to county school. Mr. Joseph Owen, architect, Menai Bridge.

BEXLEY.—Sept. 15.—For constructing pipe sewers. Mr. E. Reeve Boulter, Urban District Offices, Bexley Heath.

BEXLEY.—Sept. 15.—For supplying road materials. Mr. E. R. Boulter, surveyor, Bexley Heath, Kent.

BIRMINGHAM.—Sept. 18.—For constructing brick culverts and pipe sewer. Mr. John Price, Council House, Birmingham.

BOOTLE.—Sept. 30.—For building school. Messrs. Cox & Marmon, architects, 11 Dale Street, Liverpool.

BOURNEMOUTH.—For building Wesleyan church and schools. Mr. R. Curwen, architect, 112 Hamilton House Bishopsgate Street Without, London, E.C.

BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

BRADFORD.—Sept. 28.—For building seven houses and house and shop. Mr. Samuel Robinson, architect, 15 Cheap-side, Bradford.

BRISTOL.—Sept. 15.—For improvements to carriage and footways. Mr. T. L. Lewis, Parochial Offices, St. George's, Bristol.

BROMBOROUGH.—For building detached villa. Messrs. Bell, Williams, Son & Co., 40 North John Street, Liverpool.

BROMSGROVE LICKEY.—For building residence. Mr. F. J. Yates, architect, 1 Newhall Street, Birmingham.

BROWNHILLS.—Sept. 14.—For making-up road. Mr. J. H. Shaw, Public Buildings, Brownhills, Staffs.

CAMBERWELL.—Sept. 13.—For paving new streets. Mr. O. S. Brown, Vestry Hall, Camberwell, S.E.

CARLISLE.—For building warehouses. Mr. T. Taylor Scott, architect, Carlisle.

CHADWELL HEATH.—Sept. 28.—For building foundations, lodges, &c., in connection with lunatic asylum. Mr. Lewis Angell, Town Hall, Stratford.

CLACTON.—Sept. 15.—For paving and making-up roads. Mr. A. R. Robinson, Town Hall Buildings, Clacton-on-Sea.

CREWE.—For furnishing and fitting-up technical institute. Mr. J. A. Jenkins, Municipal Offices, Crewe.

DOUGLAS.—Oct. 2.—For constructing brick and stoneware pipe sewers. Messrs. Stevenson & Burstal, 38 Parliament Street, Westminster.

EASINGWOLD.—Sept. 17.—For widening and fencing road. Mr. F. J. H. Robinson, Rural District Council Offices, Easingwold, Yorks.

EAST PRESTON.—Sept. 13.—For bricklayer and plumbers' work at workhouse. Mr. H. Howard, Town Offices, Littlehampton.

ELGIN.—Sept. 17.—For building artisans' dwellings. Mr. Geo. Sutherland, architect, Elgin.

ERDINGTON.—Sept. 29.—For making roads. Mr. H. H. Humphries, Public Hall, Erdington, near Birmingham.

EUSTON.—Sept. 14.—For widening Rectory Bridge, Euston, near Thetford. Mr. F. Whitmore, architect, 17 Duke Street, Chelmsford.

FALMOUTH.—Sept. 16.—For alterations and improvement of the Smithick Schools, boys and infants' department. Mr. W. Jenkins, clerk, Falmouth.

FARNHAM.—Sept. 15.—For repairing bridge. Mr. E. Crundwell, Rural District Council Offices, South Street, Farnham.

FELIXSTOWE.—Sept. 15.—For constructing sewers. Mr. G. S. Horton, Town Hall, Felixstowe.

FINSBURY PARK.—Sept. 13.—For laying wood paving on concrete foundation. Mr. E. J. Lovegrove, Hornsey Urban District Council Offices, Southwood Lane, Highgate, N.

FOLKESTONE.—Sept. 13.—For building fifty artisans' dwellings. Mr. John White, 29 Dover Road, Folkestone.

FORRES.—Sept. 27.—For additions to hydropathic establishment. Mr. John Forrest, architect, 129 High Street, Forres, N.B.

GLOUCESTER.—Sept. 25.—For laying stoneware pipe sewers, with manholes, ventilators, &c. Mr. J. F. Trew, County Chambers, Gloucester.

HALIFAX.—Sept. 14.—For erection of a school for 230 children at Salterlee, Shibden. Mr. Joseph F. Walsh, architect, Lancashire and Yorkshire Bank Chambers, Halifax.

HALIFAX.—Sept. 14.—For erection of confectionery works (covering an area of over 1,300 superficial yards) in Queen's Road and Hammond Street. Mr. Medley Hall, architect and surveyor, 29 Northgate, Halifax.

HALIFAX.—Sept. 29.—For building dwelling-house. Messrs. C. F. L. Horsfall & Son, architects, Lord Street Chambers, Halifax.

HEATH TOWN.—Sept. 18.—For paving and making-up road. Mr. R. E. W. Berrington, civil engineer, Wolverhampton.

HEBDEN BRIDGE.—Sept. 18.—For constructing pipe sewers. Messrs. Newton, 17 Cooper Street, Manchester.

HORNSEY.—Sept. 13.—For constructing stoneware pipe sewers. Mr. E. J. Lovegrove, Hornsey Urban District Council Offices, Southwood Lane, Highgate, N.

HORTON.—Sept. 17.—For alterations and repairs to Lask Edge chapel. Mr. Herbert Clews, Horton.

IPSWICH.—Sept. 15.—For erecting emergency staircase, wing, &c., at the Co-operative Hall. Messrs. Eade & Johns, architects, Cornhill Chambers, Ipswich.

KENDAL.—For building cycle-enamelling-house. Mr. J. Stalker, architect, 57 Highgate, Kendal.

YORK.—Sept. 29.—For widening and laying-down railway. Mr. C. N. Wilkinson, North-Eastern Railway Company, York.

A PORTION of one of the piers of the old bridge over the Jed at Canongatefoot, Jedburgh, has been taken down in consequence of its having been in a dangerous state, and is being rebuilt. This bridge, which is believed to belong to the twelfth century, is said to have been built to afford the means of transit for the stones used in the erection of the abbey. The bridge is a strongly built structure, with three ribbed arches, but for many years it has been used only for foot passengers.

WALTHAMSTOW.

For building cottage residences, Chester Road, for the Freehold
and Leasehold Investment Company, Limited. Mr.
EUGENE C. BEAUMONT, architect, 78 Fleet Street.

F. NOAKES, Canning Town (*accepted*). £3,500 0 0

WEST BROMWICH.

For supplying heating apparatus in the Beeches Road school.

JONES & ATWOOD (*accepted*). £355 0 0

For builders' work in connection with same.

J. MALLIN (*accepted*). £196 0 0

TRADE NOTES.

THE new intermediate schools, Llandrindod Wells, Radnorshire, are being warmed and ventilated by means of Shorland's patent Manchester grates, exhaust roof ventilators and special inlet tubes.

CONTRACTORS would do well to examine the "Ebor" patent horse-shoe before the winter sets in, although it is no less efficient in summer. By the use of it horses must suffer much less inconvenience than with ordinary shoes, and that means that more work can be done by them. The offices of the company are at 25 and 29 Coleman Street, but shoeing-forges in which the "Ebor" shoe will be used are being opened throughout the country.

ELECTRIC NOTES.

THE Rotherham Town Council have resolved to apply to the Board of Trade for a provisional order empowering the Corporation to supply electricity for lighting and other purposes.

THE Blackpool Town Council have decided by eleven votes to seven that the overhead electric system be substituted for the conduit system now in use on the local tramways.

THE Dover Corporation electric trams started running on Monday, the first carriage conveying the Mayor and several members of the Corporation.

SOME members of the Manchester Corporation have gone on a visit to the Continent to inspect various electrical workings. They purpose visiting several towns in France, Germany and Belgium, and will take special note of all appliances for electric traction.

AT a late meeting of the electric-lighting committee of the Town Council of Edinburgh the engineer reported that the applications for electric light since May 18—the close of the financial year—amounted to 24,663 lamps of 8 candle-power.

AT the forthcoming exhibition to be held by the Photographic Society at the rooms of the Royal Society of Painters in Water-Colour in Pall Mall, Messrs. J. Bulbeck & Co., of 166 and 167 Strand, will have a very fine exhibit of architectural photographs. Those of Her Majesty's Theatre, which will shortly be reproduced in *The Architect*, are well worth the attention of the architectural profession.

PRICE LIST AND ESTIMATES ON APPLICATION.

BUILDING AND BUILDERS.

BATHS are about to be erected in Leith at a cost of 10,906*l*.

A CHAPEL is to be erected, at a cost of 5,000*l*., in connection with the Bridgend County Asylum at Park Gwyllt.

TWO members of the building committee of the New Infirmary, Selly Oak, say the cost of the building for 250 patients was 55,000*l*., or 220*l*. per bed, instead of 600*l*., as stated.

MR. J. WEBB, of Handsworth, has obtained the contract for the new schools in Rookey Road, for the Handsworth School Board, the cost being 11,333*l*.

AN English syndicate, operating in real estate in America, has acquired 200 acres of building land in the town of Depew, and will erect 350 dwelling-houses on their property.

THE tender of Messrs. B. Cooke & Co., of London, amounting to 11,841*l*., has been accepted by the Brighton Corporation for the erection of groynes and wooden breastwork for the protection of the foreshore to the east of the site of the Chain Pier.

THE Roman Catholic Bishop of Southwark recently laid the foundation-stone of a Catholic church at Redhill. It is to take the place of the old church, which had become much dilapidated.

A NEW swimming-bath for the north side of Edinburgh is proposed to be erected at Saxe-Coburg Place, Glenogle Road, on the lines of the bath at Dalry, with certain modifications to suit the ground. The estimated cost is between 10,000*l*. and 12,000*l*.

THE Coatbridge Dean of Guild Court has passed the plans of a new Roman Catholic church to be erected at the corner of Buchanan Street and Dundryan Road. It will accommodate 1,000 worshippers and is to cost 10,000*l*. The building has been designed by Messrs. Pugin & Pugin.

PLANS were submitted to the Altrincham Town Council for the erection of 120 houses on the Linotype estate at Broadheath, and approved, the chairman of the building committee remarking that they were built with every regard to the comfort and convenience of the workpeople.

THE "Queen Victoria Board School," Sedgley, was opened on Tuesday. The building is of brick, with moulded brick and corner-stone dressing. The largest class-room will be utilised as a board-room. The total cost of the schools, which will provide accommodation for 970 children, is over 7,000*l*., including 5,950*l*. the contract price for the building, 1,000*l*. for land

and boundary walls and 300*l*. furnishing, &c. Mr. A. P. Brevitt (Wolverhampton) was the architect, and Mr. T. Jones (Sedgley) the builder.

THE foundation-stone of new offices and board-room for Bucklow Union has been laid at Knutsford. The erection of the buildings, which are estimated to cost 4,500*l*., forms part of an extensive scheme contemplated for some years of rearranging the workhouse.

THE annual meeting of the Leeds Master Builders' Association was held at the Royal Exchange, Leeds, on the 7th inst., Mr. W. Nicholson presiding. The following officers were appointed for the ensuing year:—President, Mr. W. Nicholson; vice-president, Mr. J. Walker; and secretary, Mr. E. Schofield. It was stated that the Association is in a very strong and healthy condition, notwithstanding the recent strike of bricklayers and labourers, the membership having largely increased since last year. Amongst other important business, it was unanimously decided that the Association should join the Yorkshire Federation of Builders, the next meeting being held in Leeds on the 16th.

VARIETIES.

MR. H. E. HOARE has purchased Danbury Palace and the surrounding estate from Mr. Seth Taylor.

GRANGEGORMAN Female Prison in Dublin is about to be converted into an auxiliary to the Richmond Lunatic Asylum.

A PARISH Institute is to be erected near the church at Kingston, Portsmouth.

A PETITION is in course of preparation by the county councils and other public bodies of Wales for the introduction of the arms of Wales in the armorial bearings of the nation.

SIR EVERETT MILLAIS, son of the late Sir John Everett Millais, president of the Royal Academy, succumbed to inflammation of the lungs on Tuesday night.

THE folly on Chatham Hill called "Jezreel's Tower" has again failed to find a purchaser. The highest offer at the auction was 3,950*l*., although the breaking-up value is said to be 6,000*l*.

A SITE has been secured in Paisley on the Greenlaw estate for the new Eye Infirmary which Provost Mackenzie is presenting to the town. The ground value has been purchased to save annual burthens on the institution. It is expected that the infirmary will cost 5,000*l*.

THE Glasgow Archæological Society on Tuesday visited Linlithgow. The church of St. Michael was described by Mr. Honeyman, R.S.A., who has had charge of the restoration.

THE admission fees now paid for entrance to the historical apartments of Holyrood Palace are to be abolished after April 1 on the understanding that the magistrates and Council of Edinburgh will extend the present police assistance to the six days a week during the summer months free of expense, also that the hours of admission to the apartments will be from 10 A.M. to 5 P.M.

M. RODIN has finished the sketch model of a new monument of Victor Hugo, which he has been commissioned to erect in the Panthéon, Paris. The poet is represented as enveloped in flowing robes ascending his pedestal, while Iris, the messenger of the gods, floating over his head, points out the way, and sea nymphs wave their welcome. Another statue of Victor Hugo, by the same artist, was exhibited in the last Salon. He is now executing it in marble, and when finished it is to be placed on a low pedestal in the Luxembourg.

THE Blackpool Town Council, at the monthly meeting on the 7th inst., decided that the town clerk should seek, by an Improvement Bill to be introduced in Parliament next session, for compulsory powers for the acquisition of property running along Market Street, Upper West Euston Street and Lytham Street. This includes two hotels and a number of large business establishments, all of which are to be demolished in order to enlarge the market. The sum required to carry it out will be considerable.

IMPORTANT works are now in progress at Edinburgh Castle in connection with the erection of a new military hospital, for which a grant of 18,000*l.* was recently voted by Parliament. The site of the operations is at the north-west corner of the ground towards Princes Street and Castle Terrace. The new buildings will be treated in the Scottish style of architecture, and will occupy the place of the stores and magazine which formerly occupied this site. The interior arrangements will be of the most approved description for comfort and efficiency, in accordance with the best modern ideas, and the building, it is expected, will be ready for occupation within one year. The north block will be occupied solely by wards, while the south block will be occupied by doctors' and attendants' rooms, stores, &c. The whole of the sanitary fittings will be placed in conveniently situated specially constructed annexes. The kitchen apartments will be situated in a detached block con-

nected to the main buildings by a covered glass corridor. The contract for the whole work has been entrusted to Mr. Colin Macandrew, Lauriston Gardens.

COLLAPSE OF SCAFFOLDING.

ON Saturday, the 4th inst., the ceremony of laying the foundation-stone of the chancel arch column of the new Roman Catholic church at Shieldmuir, near Wishaw, was performed with the customary rites by Bishop Maguire. When finished the church will be a handsome and commodious structure, and will have seating accommodation for 1,000. The building is designed in the Early Decorated style, and will consist of chancel, nave, side chapels, aisles, baptistery, sacristies, confessionals, &c. The internal length is 125 feet, 58 feet in width, and the internal height 58 feet. Red sandstone is being used in the construction, and the estimated cost is 6,250*l.*, the designs being by Messrs. Pugin & Pugin. There was an attendance of nearly 2,000 in the building when the ceremony took place. Two large scaffoldings, accommodating fully 500 each, had been erected at each side of the building. The bishop conducted the usual service, invoking a blessing on the stone and putting it into position. The jar within the cavity of the stone contained current newspapers, directory of Scotland, manuscript history of the parish, giving population, description of boundaries, chapels, schools, together with the names of the bishop and other Church functionaries within the diocese. While the bishop was addressing the assemblage the proceedings were abruptly terminated by a somewhat alarming accident. Part of the north scaffolding, unable to bear the stress put upon it, suddenly gave way and about 150 people were precipitated to the ground, a depth of fully 15 feet. Almost a panic ensued, great terror and excitement prevailing among the large crowd of women and children present; but with commendable presence of mind the bishop and priests, assisted by several policemen, managed to maintain order. When the excitement had subsided it was found that the mishap had resulted less seriously than was at first feared, the supports of the scaffolding having broken the fall to a great extent. Fortunately no person was underneath the erection at the time it gave way. A large number, however, were badly bruised. The Wishaw ambulance waggon was sent for immediately after the accident, but as it was subsequently found that none of the injuries were very serious, the waggon was not required.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

NEW CATALOGUES.

THE catalogue of special sanitary and hydraulic apparatus and castings and other patent specialties of Messrs. Adams & Co., the sanitary engineers of London, York, &c., suggests the perfection which they have obtained in one of the most important classes of manufactures. They are able to say that the great bulk of sewer-flushing syphons used in England and abroad were produced by them. The apparatus represents applications of hydraulic science, and on that account the catalogue is worth study, and will be found invaluable in the offices of all engineers who are connected with sanitary works. Care is taken to keep the apparatus as simple as possible, and as the parts are liable to be roughly handled, provision is made to insure strength. This is especially seen in the penstocks and flap valves. One section of the catalogue is devoted to Adams' patent sewage lift, which has been adopted in several towns, and has realised all that was expected from it. The illustrations can be easily understood by those who are not possessed of technical knowledge, and the catalogue should be brought under the notice of sanitary committees and others who have assumed the responsibility of dealing with the sanitation of towns.

About a year ago we noticed a new drain-pipe devised by Mr. Plummer, architect, Newcastle-on-Tyne. The specialty consisted in the lower part having a smaller diameter than the upper part. This pipe is now manufactured by Oates & Green, Limited, of Halifax. They also possess many other patents of their own and of others. Among them are an automatic waste water-closet, the "Skroy" closet, the "Flekker" closet, the "Zafila" latrine, the automatic box latrine, various tipper boxes, ventilators, traps, valves, &c. They also manufacture glazed pattern bricks, with excellent and suitable ornament,

patent inlet bricks, and a whirlpool heater for large baths. The prices are exceptionally moderate, and would be impossible unless a very large sale was certain.

WORKMEN'S DWELLINGS IN LIMERICK.

AT the meeting of the Limerick Corporation held on the 2nd inst., the Mayor presiding, Bishop O'Dwyer attended in reference to the scheme for erecting workmen's dwellings in the old part of the city. The estimated cost he said was 10,000*l.*, and Mr. James Fitzgerald Bannatyne, D.L., would contribute 2,000*l.*, while the firm would give another 1,000*l.* Mr. Alex. W. Shaw, J.P., would give at least 1,000*l.*, and Lord Iveagh would subscribe 1,000*l.* on condition that the remaining 9,000*l.* were forthcoming. Bishop O'Dwyer had also obtained promises of support from Messrs. Denny, and he had no doubt that the entire capital would be forthcoming. The Local Government Board have sanctioned the scheme and obtained the necessary statutory powers from Parliament for the undertaking. After some conversation the city architect was directed to take the necessary steps for putting the scheme into operation by arranging for the compulsory purchase of sites and premises preparatory to the erection of the new buildings.

A NEW DEVELOPMENT IN THE STONE AND GRANITE TRADES.

IN confirmation of a paragraph inserted by us a month or two back, we now learn from a reliable source that the amalgamation of several important stone and granite quarries in the West of England has been completed, and the company has been duly registered as the Hard Stone Firms, Limited.

The capital is 100,000*l.* in 10*l.* shares, with no founders' shares, debentures, or preference shares. This combination may be regarded as a natural development of the Bath Stone Firms (though essentially distinct), whose business has been so successfully managed that in 1896 a dividend of 9½ per cent. was declared, their 10*l.* shares being quoted at 19½*l.* Five of the directors of that company will be on the board of the Hard Stone Firms, and Mr. John T. F. Turner is the secretary of both companies.

Mr. T. Forster Brown, M.Inst.C.E., the eminent valuer of

THE NEW EXPANDED METAL

Mesher from 1/8th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

Westminster and Cardiff, and Mr. John Wainwright, of Shepton Mallet, were requisitioned to report upon and to value all the properties, and Messrs. J. & A. W. Sully, of Queen Victoria Street, E.C., with Messrs. Ham, Dennehy & Butcher, of Bath (all chartered accountants), duly audited and certified the accounts.

We are not surprised to learn under the above circumstances that there was no necessity for appealing to the public to subscribe for shares, nor that the directors, through the ready response of the shareholders of the Bath Stone Firms and their own subscriptions, were able without delay to go to allotment, thus saving the heavy expenditure of newspaper advertising, diffuse circulation of prospectuses, &c.

The quarries now the property of the Hard Stone Firms, Limited, are as follows:—

The Pennant Quarries at Fishponds, Stapleford and Hallatrow, belonging to the Bristol Pennant Firms, Limited.

The Keinton Quarries, situate at Keinton Mandeville, Somerset, belonging to Mr. W. A. Sheppard and the Keinton Stone Company.

The Street Quarries, situate at Street, near Glastonbury, belonging to Messrs. Clothier & Seymour.

The products of the foregoing quarries are admittedly of great value for engineering and architectural work, and the demand for them has for several years been largely in excess of the output.

In addition to the above-named works, the amalgamation includes the De Lank Granite Quarries, near Bodmin. These quarries produce the celebrated Cornish granite, of which the new Eddystone Lighthouse, the Tower Bridge and other large well-known engineering works have been constructed. It has been for many years used in the post offices and police stations, e.g. the General Post Office, St. Martin's-le-Grand (basements), and the new Scotland Yard (doorway).

The 200 horse-power developed from the river De Lank is available for polishing, turning and sawing machinery, and direct railway communication recently completed connects with the ports of Fowey and Wadebridge. These are undoubtedly economies which should facilitate trade.

Road kerbing and paving setts made from this granite are now gradually superseding Norwegian and other foreign rock, as De Lank is of equal if not greater durability; while instead of wearing smooth and slippery after a few months of vehicular and foot traffic, this granite wears rough, thus giving the important desideratum of improved foothold.

Borough engineers and surveyors, as well as elected members of corporations, and the public generally, will share with us the feeling of satisfaction that it will no longer be necessary to import from and pay to foreign countries for kerbing and setts which our own countrymen can produce at the De Lank quarries.

The directors of the Hard Stone Firms are all well known in the commercial world as experienced men of business, and there would appear to be an absence of the usual ornamental names on the board. Mr. Herbert Pictor is the chairman, as he was of the Bristol Pennant Firms, Limited; he and the following gentlemen are also directors of the Bath Stone Firms, Limited:—Messrs. Cripps, R.E., Giles, J. Sumsion and J. T. F. Turner. Mr. T. Kyffin Freeman, F.G.S., of the firm of Freeman & Freeman, 200 and 202 Phoenix Street, N.W., and Westminster, will be the director in London.

THE JEWISH SETTLEMENT IN ESSEX.

ACCORDING to the *Essex Herald* the Israelites are flocking in still greater numbers to buy land at Benfleet. About 450 attended the first sale held on the new Thundersley Manor estate, adjoining the Kent Hill and Thundersley Park estates, where the former sales were held. In spite of the heavy rain over 300 plots were sold, chiefly, but not entirely, to Jews, and the amount realised was 2,852*l*. No fewer than 300 applications to attend the sale had to be refused, because it was felt that it would be impossible to accommodate more than actually went. Probably, if train, tent and provisions had been adequate, there would have been from 1,000 to 2,000 Jews down for the sale, and most of them intending buyers.

It is proposed to hold sales on the estate every Wednesday up to the end of October, by which time over 3,000 plots of land will no doubt have been disposed of. So far the vendor's trouble has been to convince those wishing to attend the sales that it is impossible for him to accommodate more than 400 or 450 at any one sale.

It is evident that the Jews are going to turn Essex land to good account. Already preparations are being made for the building of houses and factories. A syndicate of Jews has bought a block of land of some 27 acres at the back of the estate to convert into brick and tile works and factories. There

is quite a land mart in Jewry; the Israelites are buying and reselling at considerable profit to those who have come later "into the field," but the plots are not used as mere counters. Buyers have a keen appreciation of the advantages of one plot over another. And so far as the old inhabitant, the Essex labourer, is concerned, he is no sufferer—quite the contrary, for he is now getting from 3s. to 5s. a week more than he had before.

THE SANITARY CONGRESS.

THE sixteenth Congress of the Sanitary Institute is to be held at Leeds from the 14th to the 18th inst. A very large local committee has been formed, of which the Lord Mayor of Leeds (Sir James Kitson, M.P.) is the chairman, and the Town Hall, the Yorkshire College and other buildings have been placed at the disposal of the Congress for meetings. A considerable number of delegates, representing the War Office, county councils, county boroughs, urban district councils, sanitary authorities, rural district councils, port sanitary authorities, school boards, universities, societies and medical bodies, have been selected to attend. No effort has been spared at Leeds to secure that the gathering shall be successful, and the Institute in London has been at work for some time. The council, of which Sir Douglas Galton is chairman, has now almost completed the arrangements.

The president of the Congress is Dr. Robert Farquharson, M.P., who will deliver his inaugural address in the library of the Yorkshire College at three o'clock on Tuesday, September 14. The subject will be "Some Defects of Modern Civilisation, with Hints for the Improvement of the Human Race." An exhibition of sanitary appliances will be opened in the Camp Road buildings in the evening of the same day. The second day will be occupied with a series of conferences, six in number. In every case the president will deliver an address, and papers will follow. The conference on river pollution will be presided over by Major Lamorock Flower, sanitary engineer to the Lea Conservancy Board. Amongst his recommendations will be found one in favour of the creation of a central inspector of sources of water supply. Papers on the general question, and on the purification of trade effluents, are also to be read. The conference of municipal representatives will be presided over by Mr. Councillor B. Womersley, chairman of the Leeds sanitary committee, whose address will be local and

historical. Papers are promised dealing with the subjects of the Church and Sanitation, Working-Class Dwellings in Belfast, the Influence of Large Towns on the Sanitary Progress of neighbouring Small Towns and other matters. Medical officers of health also meet in conference under Dr. Edward Seaton, and there is a considerable list of papers referring to Small Isolation Hospitals, Poisoning by Tinned Foods and its Prevention, &c. Dr. Sykes (St. Pancras) will contribute a paper on Artisans' Dwellings as affected by Customs and Inland Revenue Acts; and the Assistant Professor of Public Health at University College, Mr. H. Kenwood, M.B., will detail some experiments showing that formic aldehyde vapours effectually disinfect rooms quickly and without affecting the colours and textures of fabrics. Mr. Thomas Hewson will preside over the conference of municipal and county engineers. Subjects for discussion comprise the Disadvantages and Dangers of Combined Drainage, Sanitary Aspects of Wood Pavement, Storm Water Drainage, &c. The sanitary inspectors will meet under Mr. Peter Fyfe, chief sanitary inspector of Glasgow, at the School Board offices. The ladies' conference on domestic hygiene will meet in the Methodist New Connexion hall. The day's work will be followed by a conversazione and reception by the Lord Mayor in the Art Gallery in the evening.

The three sections will begin their work on the Thursday and continue it on the Friday. Mr. Pridgin Teale will preside over and address the section on Sanitary Science and Preventive Medicine. The subjects for papers comprise:—Sanitation in Relation to Food Supply, Infant Mortality, Hygiene in Elementary Schools, Sewage in Estuaries, and the Amendments and Administration of the Vaccination Acts. Section II. deals with Engineering and Architecture. Its proceedings will be opened with an address from its president, Mr. Lewis Angell. The topics of the papers will include Sewage Filtration, Disposal and Purification, Fever Hospitals, Baths and Washhouses. Section III.—Chemistry, Meteorology and Geology—has for its president Mr. W. Whitaker, who is to offer suggestions about federation for water-supply. On Thursday the lecture to the Congress in the Albert Hall will be given by Mr. H. Percy Boulnois, city engineer of Liverpool, on Some Sanitary Advances in Municipal Engineering. The Congress will conclude with a lecture by Mr. Philip Boobbyer, medical officer of health, Nottingham, on the Essentials of Popular Hygiene. The Sanitary Exhibition will remain open until October 9.

SOHO COWL AND VENTILATOR (NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

ALHAMBRA, BLACKPOOL.

THERE is no holding Blackpool back, says a correspondent of the *Leeds Mercury*. She goes cheerfully and easily, from one large enterprise to another. Indeed she is quite equal to having two or three great schemes on hand at once. Her purse is apparently as elastic as her ambition is high. This queen of western health resorts deals airily in hundreds of thousands of pounds sterling, the while her less fortunate or more calculating sisters boggle over sums that are tiny by comparison. Yet Blackpool is not satisfied; while the enlightened and public-spirited municipality are hard at work on improved drainage schemes that will tend to make the place healthier than ever—if such a thing be possible—and are making vast improvements on the foreshore by the building of a substantial sea-wall at a cost of something like 100,000*l.*, to say nothing of contemplating a widening of the existing promenade at an expenditure that would simply appal a more conservative and slower-going community, private enterprise is stalking along at a pace quite as breathless. It was announced yesterday that a start is to be made at once with the erection of the Alhambra that is to rise on the site of the existing Prince of Wales's Theatre. The architects of this new venture are Messrs. Wylson & Long, of King William Street, London, and by their courtesy we are in a position to furnish some details which will serve to show the character of the scheme, the carrying out of which will involve an outlay of considerably over 100,000*l.* Indeed, the contracts just let exceed that sum. Messrs. Wylson & Long are no mere experimenters in this class of work. They have gained a well-deserved reputation for theatrical architecture, and their connection with the affair is an ample guarantee that everything will be carried out on first-class lines. This firm were responsible for the Oxford Music Hall in London, for the Empire at Bristol, which ranks as the finest building of its kind in the West of England, for a theatre at Bath, and they now have on hand two handsome music-halls in South London. Nor are they strangers to Blackpool, for the recent extensions at the Pavilion were made in accordance with plans they prepared.

The design of the Alhambra is exceedingly rich, and it is to be executed in the most generous fashion. The company are going to allow no cheeseparing; everything is to be of the best. The elevation to the Promenade will be very striking, and will unquestionably prove a notable addition to the architectural features of Blackpool, and if one may be forgiven for saying so, even Blackpool can afford to make room for a few more

good ones. The architects have adopted the Renaissance style—there is nothing but Renaissance nowadays—and treated somewhat freely. The result is admirable. The façade is well “broken,” and contains not the least suspicion of dullness or of the commonplace, while stone is to be employed, and this will be relieved by marble pillars supporting arches that are to cover a spacious balcony. The main entrance will, of course, be in front. This leads to a fine hall, in which the booking offices will be situated. To the left will be a splendid circus, and above it a palatial dancing-hall; on the right a gorgeous variety theatre. To these add an arcade and five shops, and the scheme is complete.

The circus is, perhaps, the most important part of the building. It will be seated to accommodate at least 2,000 people, whose every comfort and convenience will be studied to the utmost. There will be two entrances—one from the Promenade and the other from Bank Hey Street. The ring is to measure 60 feet by 40 feet, and arrangements are to be made whereby a portion of this area can be transformed at will into a bath, in which swimming entertainments can be given. The stabling for the horses will be situated under the tiers of seats. The dancing-hall overhead has been more or less an afterthought, but Messrs. Wylson & Long have succeeded in adding it without in any way destroying the symmetry of their original plans. This hall will extend from front to back of the building, and, if experience goes for anything, is bound to prove attractive to Blackpool's fleeting population, and mayhap to that portion of it which is residential. The variety theatre on the opposite side of the building will be replete with all that is modern. Without being gaudy, the decorations will be elaborate; in fact, it promises to be one of the best halls in the country. Doubtless the management will take very good care that the performance is worthy the surroundings. With regard to the exterior, it may be added that the intention is to place handsome balconies on the first and second floors running the whole length of the building, the one 7 feet and the other 5 feet wide, so that those who attend the “shows” may come out occasionally and obtain a whiff of fresh sea air. The capital of the company who are erecting the Alhambra is 220,000*l.* The tender of Messrs. Whitehead, of Blackpool, has been accepted for the erection of the general building work, furnishing and decorations at a cost of 76,200*l.*, and that of Mr. Samuel Butler, of Leeds, for the constructional ironwork at a cost of 12,788*l.* Messrs. Shoolbred's tender for the seating is 6,500*l.*

LABOURERS' COTTAGES.

In a communication to the *Land Magazine* on this subject, Mr. Bolton King says:—There is no question that concerns the agricultural labourer more than the provision of good cottages. There has probably been a levelling-up of their standard almost everywhere of late years; sanitary authorities have been more active, and the depopulation of the villages has allowed the worst cottages to tumble down. But now that the depopulation is checked—at least in some districts—the supply is often unequal to the demand, and there is a large number of indifferent cottages past repair, which sanitary authorities are slow to condemn, because their destruction would drive their inmates away or cause overcrowding in the remaining houses. Thus there is a serious need of more cottages in many villages, not only to replace cottages that ought to be pulled down, but to supply a present scarcity. But it is well at the outset to face the difficulties, and social enthusiasts are too often ready to assume that local authorities only want permissory powers to rush into cottage-building. It is disagreeable, no doubt, to be told that it is impossible to build well-constructed five-roomed cottages to pay 3 per cent., but such is unfortunately the case. I have had myself considerable experience in building labourers' cottages, and I believe the figures I give are below rather than in excess of the average cost. Every cottage should, in the interest of health and decency, have two rooms downstairs and three bedrooms however small upstairs. The outer walls should be $13\frac{1}{2}$ inches thick, and, unless the bedrooms are to be intolerably hot in summer, the roof should be tiled and not slated. There must be a small pantry indoors, and closet, pigstye and hovel out of doors. There should be a quarter acre of garden ground, in the interest of the landlord no less than the tenant, for the cottagers will pay additional rent for it much in excess of the agricultural value of the land. For this reason it is undesirable to build cottages in rows. Now the plainest pair of cottages on these lines costs 300*l.* (I have myself never built for less than 305*l.*) Their outbuildings, constructed of rough planking and corrugated iron roofs, cost about 50*l.* The value of half-acre of land, which must necessarily be frontage land, cannot be put at less than 15*l.*, and would often be more. Then there is the cost of paths, sometimes of roads, of water-supply and of drainage. The expenses of these will vary very considerably. In my own case roads and paths cost in rough figures 13*l.*, water 10*l.*, drainage 11*l.* per pair of cottages.

The total cost of a pair of cottages will, therefore, be:—

Cottages 300*l.*, outbuildings 50*l.*, land 15*l.*, roads, water, drainage (say) 35*l.*; total 400*l.*

Now for the return. I charge 6*l.* per cottage. In most agricultural districts this is the maximum cottage rent. My rates average 2*s.* 8*d.* in the pound, insurance 4*s.* 2*d.* per pair of cottages, and repairs average one guinea per cottage.

The income, therefore, from a pair of cottages is:—Rent, 12*l.*; less rates 1*l.* 12*s.*, insurance 4*s.* 2*d.*, repairs 2*l.* 2*s.*—total, 3*l.* 18*s.* 2*d.*, leaving a net rental of 8*l.* 1*s.* 10*d.*

This makes the net return for outlay 2*o*2 per cent. I do not believe that it will be found possible to reduce the cost much below the figures given above, and I believe it is the universal experience of persons building healthy well-constructed cottages that they will not pay 3 per cent. If therefore such cottages are to be built in villages, one of two things must happen. Either the cost of building must be materially reduced, and this can be done only by finding a cheaper building material. I am no expert to pronounce on the possibility of this; but some public-spirited individual or body might do worse than offer a substantial prize to any person who could discover the desiderated material. Or we must face the fact that cottages have to be built at a loss, and recognise that it is to the public interest to provide decent homes for the people, even if it means an additional burden to the rates. I think it is impracticable to wait till labourers can afford to pay a higher rent. In the present condition of agriculture any rise of wages is more than problematical, and I think that those who know village life will agree that it will be long before the labourer is able or willing to pay more than 6*l.* for his cottage. I speak, of course, for the Midlands and South. Circumstances are different in the North, where wages are higher and work more regular.

THE RESTORATION OF ANCIENT CHURCHES.

THE following suggestions by an amateur appear in the *Church Times*—

So much irreparable mischief has formerly been done to our churches under the guise of restoration that no apology is needed for an earnest endeavour to put clergymen and churchwardens on their guard in this matter. In so doing I have no intention of making libellous statements or insinuations, but am content to let bygones be bygones and counsel precautions in the future.

Doubtless church restoration is usually entered into on the part of the clergy and churchwardens with the very best of inten-

tions and with much honesty of purpose. But honesty of purpose is one thing, and a practical knowledge of the principles of church restoration is another. The custodians of our churches should make themselves acquainted with the various styles of church architecture, so as to be ready for the combat which may be necessary in order to prevent vandalism or the introduction of new uncharacteristic work into our churches.

A difficulty may arise in that the particular church in hand presents varying styles of architecture at different points—one part is Early English, another is Perpendicular and so on. Very well. If it is original work the probability is that although the styles vary the general character as to extent of ornamentation, elaboration or plainness is preserved, so that the general effect not only does not suffer, but the variation of style reveals to the initiated many points of interest. Restore and copy what you find is original work, and throw new designs for alterations to the winds.

Generally speaking, as little new work as possible should be introduced, true restoration consisting of simply repairing and renewing only those portions which are decayed or unsafe, faithfully copying the better preserved portions of the original work. It very rarely, indeed, happens that all traces of the original mouldings, stringings, tracery, &c., have disappeared, but if they have, copies can be obtained from a church of similar style elsewhere, and the nearer such an one can be found the better. It is a great mistake to design new work for old churches (unless extreme care is taken), for even if the style is correct for the period, you may find out too late that the elaborate tracery of a new window in your plain church painfully attracts the attention, to the equally painful detraction of the original work. Such a window, however good it may be in itself, looks, as it is indeed, entirely out of place.

Anything new which is likely to absorb attention to the detraction or exclusion of other portions must be utterly condemned. It will not blend. What is required is honest restoration, not alteration. Beware of going in for what is termed a "general restoration," that is, handing over the venerable structure to either architect, builder, or contractor, and letting him do the lot in one job; resulting in a spick and span, brand new, cheap and nasty modern revolution in tiled work, bricklayer's pointing, flimsy joinery, &c., with all the latest improvements; utterly unrecognisable as part and parcel of the grand old church. Better by far to personally super-

intend the village carpenter and mason in simply copying and repairing, especially as high finish and servile accuracy are not required in a plain church, but only good wrought work as it leaves the tool; no filing, rasping, sandpapering, or polishing up. Take my advice and restore your church by degrees—in detail—and not by wholesale jostling of arts in disorder and confusion.

A good plan is to employ a competent church architect, and let him prepare a complete scheme or specification of restoration, and plans and details of any new works which may be considered to be necessary to its ultimate completion as a whole, and divide the work into various portions, with an approximate estimate of the cost of each section. These papers, if satisfactory, can be kept for reference and use when required.

Attend to one thing at a time and devote your constant personal supervision to the work; do it thoroughly well, employing good individual artisans to individual trades, and use only the very best of materials.

Don't be in a hurry, and if you have to build up new work against old work, do it a little bit at a time, and rest it to set and settle, or build it in cement and well washed road sand in equal parts. Remember that cement swells in setting, and is therefore better for underpinning, walls, &c., than mortar, which shrinks in setting. But good mortar is not to be despised for ordinary use. New masonry and rubble-work cannot be done too slowly, nor grouted too frequently whilst the work is in progress. The surface of the old work should be well hand-picked and roughed to a new face to form a clean key, and thoroughly well wetted to secure adhesion. Eschew all such iniquities as iron corrosive ties to masonry, especially secret ones; and let everything you do be honest and fair and above board. Do not, on any account, attempt concealment, or, worse still, deception; let everything show and be left to look what it is, and the result will be satisfactory. I remember a case in point which will well illustrate my meaning. A builder once suggested painting a piece of lead flashing to match the colour of the tiles on the roof. The architect replied, "Oh, no! anyone who understands the work will know that the flashing is necessary, and expect to find lead there."

Architects should not be recompensed by the acreage of their plans, drawings and specifications, or by commission on the amount of the cost of the work, but for the skill they display

CASES for BINDING THE ARCHITECT.
Price 2s.—Office: 175 Strand, London, W.C.

in preserving as much as possible of the original work, and in faithful duplication.

Any estimate which may be prepared should never be slavishly adhered to.

Competition contract is fatal to good work, and stands self-condemned, as it is only to be expected that the acceptance of the lowest tender risks the satisfactory completion of the work, there being great scope and temptation in such material as concrete and hidden work to save expense to the contractor. The labourer is worthy of his hire; therefore do not tempt honesty to stumble by a dishonest attempt to obtain the best of the bargain.

Architects sometimes have fads; one rejoices in tracery, another introduces ironwork, another goes in for a particular kind of stone (instead, perhaps, of using the local material of which the church is built), and so on, and do not consider that the work is satisfactory until one or other has been introduced. This feeling must, if necessary, be sunk in favour of true restoration.

Never attempt the impossible task of improving upon the original, nor humiliate the dignity of humble work by endeavouring to make it tell a lie.

English oak is the standard wood for our church work, but foreign is much used, being milder and easier to work. Chestnut was formerly frequently used, but it fails and decays at the knots. Quarry stone should be of similar kind to the original, if that is suitable and procurable.

The most important matter in a church is the state of the foundations of the walls, piers and columns. Years ago graves and vaults used to be dug (inside as well as outside) sometimes quite close to the walls. In such a case it is necessary to underpin the walls—in short lengths at a time—and carry the foundations down in good cement concrete to a solid bottom below the depth of the graves or vaults. Also to lay the surface of the ground outside the walls to a fair fall outwards, providing suitable lead (not cast-iron) rain-water down pipes and drainage to a distance. If possible, lay the highest part of the fall (next the walls) well below the floor line, and provide ventilation beneath any hollow floors.

After the foundations have been seen to, look well round the walls, from a constructive point of view, and see if you can detect any weakness or want of stability. The line of columns and main piers should run from the foundations to the principals of the roof without a break in order to carry the weight straight down, and only intermediate weight should be borne by the arches, which, in their turn, should be well secured against thrust at the springing points by massive masonry, rubble-work or buttresses. Sometimes arches have been thoughtlessly formed by cutting through solid work at a vital point, involving great insecurity to the building. Well examine the buttresses and see if they are properly bonded by the quoins. The set-offs and weatherings of buttresses frequently give out, and should be set right by good large bonding stones beneath the stringing.

These remarks will also apply to the tower, and if there exists any excrescence in the shape of a Georgian spire, use your influence to have it taken off.

The general appearance of the building should be one of massiveness (in preference to lightness) of construction. Many old churches are built considerably out of truth as to orientation, plan and elevation. Do not attempt to conceal such apparent errors, as they were probably intentional. The orientation of a church is determined by pointing to the rising of the sun on the morning of the day of its patron saint, which, varying considerably according to time of year, accounts for apparent error, and in many churches the chancel is symbolically deflected.

Do not try to point up flint or rubble-work with the trowel, bricklayer fashion, but after filling up the joints flush with the flints, finish by drawing round the flints a short wooden lath. Well wet all old rubble-work and masonry in adding new work or pointing, or the new work will not adhere. It is a good plan (especially if funds are low) to leave stone carving of corbels, &c., to be finished *in situ* later on. Any plastering should be rendered in gauged stuff, and be floated, not trowelled, well wetting the walls as before mentioned.

In even rude flint or rubble-work courses should be maintained, and new work should, as far as possible, be carried up *en masse*, and not be left down in places for future completion of the mass of stonework. In very thick work it was a common practice to carry up the outer faces of the flintwork a certain distance and shoot in the middle portion; but this is inadvisable, as the process of shooting in is apt to bulge the outer faces, as, in order to secure adhesion, it must be done whilst the faces are yet in a green state; if they are allowed to set before shooting in there is no proper amalgamation or cohesion; likewise, good bonding of such work is impossible.

All quarry stonework must be laid on its proper bed, and care must be taken to provide suitable kinds of stone to stand weather and weight.

The roofs next claim attention. Look at these first from a constructive point of view, as in the cases before mentioned, and ascertain if they are the original or bastard ones, and act

accordingly. In the matter of lead gutters it is not sufficient that good laps and falls should be given, but insist also upon having good, deep drips, or the gutters will fill with frozen snow, and when it begins to melt the water will run back over the laps and get in. Have plenty of outlets of good dimensions, and do not let the plumber lay the roof lead in sheets of too large a size, or the expansion and contraction will cause the lead to crack. Provide that the water does not discharge or splash on other roofs, but carry it down as before mentioned. Have good flashings where required, and get rid of the roof water in the shortest available distance, as long falls are usually slight falls, and are undesirable from many points of view. It is not sufficient to simply provide a fair water-way, but a good margin must be allowed for blockage. Avoid square elbows in down pipes, awkward turns in gutter work and lodgments for snow. Let common sense dictate. The upper edges of flashings and gutters should be properly protected against the possibility of becoming loose, either by stepping into the walls, or by being covered by a narrower supplementary flashing built or let into the wall and folded over.

The capitals of columns and the tracery of windows were formerly often worked in a soft kind of stone called clunch, but in restoration a much better material is desirable.

The tracery and lights of old windows are seldom exactly true; therefore in ordering new lead lights it is best to cut a paper pattern or tinplate to fit in full size, marking the inside and outside, and the order and number of the lights. Send also a rough sketch of the window—the maker to allow for the grooves in the stonework.

The seats and fittings of a church should be of a substantial and suitable character, and the former should not, as is too often the case, be made up of joiner's work and finished with a length of moulding stuck on the top and elbow. It is a pity that poppy-head bench ends do not receive more attention.

Intersections of mouldings in church woodwork should never be mitred, but may be scribed; or, in restoring old work, the joints should be of the square and butt kind, and the moulding worked on the solid endwise of the grain to complete the intersection.

Doors should be hung with long smith-wrought clasp eyes and hooks, and not with butt joints and sham clasps of cast-iron screwed on, which are worse than useless. The doors should be well braced to prevent drooping, and all outer upper edges of rails should be well bevelled to shoot rain. Remains of old carvings or screen work should be carefully preserved and restored (renewing only defective portions), even if the cost is greater than that of entire new work. Every detail of fittings and new work must be carefully considered as to proportion and style. Provide ventilation in lead lights, and see that a small channel communicating by pin-holes with the external window-sills is made at the bottom of each light, to allow condensed water to escape without steaming down the inside sills and walls.

Do not disfigure the church by tiers of hot-water pipes, and see that lamps or gas-fittings are fixed so as not to do injury by heat, nor must mouldings or ornaments be cut away for them.

Ancient internal tombs, monuments and brasses should be carefully preserved from injury by railing them in, whilst for the more modern floor slabs—if liable to defacement by traffic—permission should be sought to enable them to be removed and placed elsewhere or on the walls, or, if too large, the inscriptions to be copied on a tablet. Internal vaults should be examined and dealt with to render them safe, and if possible the contents should be removed or embedded in solid concrete.

Bells exercise so great a strain on a tower as to call for serious consideration. The lower they are placed the better for the tower, as long as they are not steeple-bound. They should be made to swing in counteracting positions to each other, and the walls should not be cut away for the bells to swing, nor should the upper part of the bell-frame touch or be wedged against the walls. Illuminated clock faces require large weakening holes to be cut through the walls, which are apt to endanger the safety of the tower, in which case they should not be allowed to be made.

A great difficulty in old churches is where to put the organ. On no account put it into an organ chamber, which, besides entailing great expense, ruins the tone of the instrument; see also that the case is in keeping with the character of the building, and not of the nature of a huge cupboard—a miracle of ugliness—which impairs and retards the tone of the instrument. The less case the better.

If at any time a defect or settlement should appear, attend to it without delay, and keep your eye on the gutters, down pipes and discharge of water.

It is hoped that these few hints may help the reader to avoid some of the greater pitfalls of modern church restoration, and enable him to assist in the preservation of what is left of the good old work by arresting the hand of the destroyer and mutilator, so that our churches may be handed down to posterity as creditably as it is possible now to do.

LIVERPOOL ELECTRIC TRAMWAYS.

At a special meeting of the Liverpool Corporation Tramways committee, just held, a communication was read from Mr. Pearson, the electrical engineer of New York, intimating that his numerous contracts precluded him from accepting any position under the Corporation, even in a consultative capacity. It was therefore unanimously agreed, after considerable discussion, that the chairman and deputy chairman be authorised to approach Dr. John Hopkinson, electrical engineer, of Manchester and London, with the view of arranging with him to undertake the designing and all the work connected with the construction of the experimental electric tramway line on the Dingle and Prince's Park routes. Dr. Hopkinson has had a wide electrical experience, one-half of the electrical haulage systems in the kingdom having been laid down under his supervision.

THE NATIONAL HARBOUR AT DOVER.

THE selected list of contractors who will tender for the construction of the national harbour at Dover have received an intimation that the plans and specifications of the works are ready. According to them the tenders should be in the hands of the Government authorities in a few weeks from the present time. The work at the eastern and western ends of the harbour will be proceeded with simultaneously so as to expedite the construction. The lengthening of the Admiralty pier seaward, which will form the western arm, is to be proceeded with at once, as it is necessary for the protection of the enlarged continental and commercial harbour which is being constructed by the Harbour Board. Before the eastern arm can be commenced a considerable area of the foreshore under the cliffs is to be reclaimed.

ARTISTIC STEEL WORK.

FROM a very early period of the world's history the production of ironwork in artistic and attractive forms has been a staple and most important industry. Tubal Cain, who, according to an old poem, was "a man of might in the days when earth was young," is supposed to have been one of the earliest artificers in iron, though, as the poem already quoted says, he appears to have chiefly "fashioned the spear and shield," each of which articles, though intended for use in war, yet afforded opportunities for elaborate and artistic ornamentation.

The spear and shield are, however, no longer in the category of lethal weapons, and instead the modern worker in iron devotes his skill to the production of ornamental ironwork for more peaceful purposes, though even in this direction important changes have taken place. Time was when ornamental ironwork was produced by manual skill, as witness the Mediæval smiths' motto, "By hammer and hand all arts do stand." In this, however, as in many another handicraft, delicate and perfected machinery bids fair to replace manual skill.

A very striking instance of this is to be found at the Victorian Exhibition, which is now being held at the Crystal Palace, or, to speak more correctly, at the stand thereat which is occupied by the exhibits of Messrs. H. & F. Bönten, of 8 Elder Street, Bishopsgate. Here may be seen ornamental ironwork in many forms and designs, and applied to many different purposes. But before mentioning—it would be quite impossible to detail—these purposes, it will be well to point out what this new ironwork is.

It is, then, wrought-iron rolled into more than two thousand different sections (or patterns), which can be utilised in a great variety of ways and applied to almost any purpose, whether constructional or ornamental, and whether for interior or exterior work. Some of the special merits of this new ironwork are lightness, indestructibility, cheapness and beauty. Besides these, however—though they are merits of no inconsiderable value—the wondrous adaptability of the new product is almost phenomenal. For instance, a section—which is of course rolled flat or in form of a moulding—can be twisted into a spiral column, and with the best result as regards strength and elegance.

Or two or more sections can be twisted together, when, as they would be of different patterns and might be of different metals, the effect would be very striking and effective. No welding is required when this intertwining is effected, as the sections grip of themselves. Thus spiral columns, large or small, can easily be made, and that either solid or hollow. A pillar to carry a gaspipe or electric lead, and a pendant for a gaselier, a covering for a water-pipe—these and many other hollow cylinders can easily be produced.

Solid work, too, is quite as readily made. From a simple banister to a heavy warehouse column anything and in numberless designs and combinations can be produced. Nor is this all. Girders, joists and other constructional work, whether for building or engineering, can be produced by this new ironwork, and thus any such work which by force of necessity or for convenience is left exposed may be made elegant and attractive.

For flat work the sections are equally adapted and in equally surprising variety. At the exhibit there is a splendid doorway made in three sections, of different but harmonious designs, the whole having a very fine effect. One advantage of Messrs. Bönten's system when applied in this way is that no masonry is necessary. There is also at the Palace a model of a shop-front all in this art ironwork. Front, fascia, door, window fanlight, all complete and perfect. The introduction of glass offers no difficulty, for the channels can be made to take glass of any thickness, and thus verandahs, shop-fronts, windows and glazed work of every description can be made elegant and artistic. Indeed, for shop-fronts this iron is specially suitable, as the sections are made with roller-blind channels attached, while the frame for the glass is also ornamental, and thus is produced a wrought-iron window which is at once handsome and inexpensive.

Another important merit of this ironwork is the fact that art metal-work would be a more appropriate title, as it can be made in iron, copper, brass, gun-metal, or aluminium, while, of course, any combination of these could be effected, and that whether twisted or in the flat. Thus, a small section in brass could be run in the hollow of a larger one in iron, while ornamental studs could be introduced with the best results.

But there is really no apparent limit to the kaleidoscopic forms in which the metals could be produced or to the purposes for which it could be used. At the Palace are several instances of this, for the exhibits include the large door frame already mentioned, two handsome frames for gates, an artistic staircase with ornamental spandrels, door knockers and pulls, stair treads, hollow cylinders for covering pipes; all these and many others down to a simple umbrella-stand, and a beautiful fire-screen, the panels of which are of coloured spar.

Altogether the exhibit of Messrs. Bönten is one of the most interesting and valuable which has ever been submitted to the notice of builders, engineers, and especially of architects. Those of our readers who may wish to inspect it should take an early opportunity, as the exhibition will close in October.

CHAT MOSS.

CHAT MOSS, through the engineering work of George Stephenson, is known everywhere, but it will in the future, says the *Manchester Guardian*, be of more particular interest to Manchester as part of the estate which considerations of health have caused the City Council to secure for the citizens. Chat Moss is a great property, for it extends over 2,600 acres. Those figures may convey little meaning to some people, who will, perhaps, form a better idea of the size of the Moss from the statement that it is $3\frac{1}{2}$ miles long by $2\frac{1}{4}$ miles broad. Or, as Alexandra Park measures 60 acres, the city is, at Chat Moss, in possession of a tract of land forty times bigger than its biggest place of recreation. The Moss is about 7 miles from Manchester, its easterly boundary being $5\frac{1}{2}$ miles from the Exchange. It was bought by the City Council in August, 1895. The purchase money, with the legal expenses, amounted to 139,350*l.* 8*s.* 8*d.* But as almost the whole of the estate was then held by leaseholders on ninety years' leases, which did not expire until February of this year, the City Council, by its health committee, can only be said to have had actual possession of the Moss for six months. It should not be concluded that Manchester has taken over such a great sweep of morass and wild bog as is described by Harrison Ainsworth in his account of the fugitive flight across the Moss. The original leaseholders of ninety years ago were men of energy. They drained and cultivated the greater portion of the bog land and intersected it with roads. No fewer than 1,900 acres of the Moss are already under cultivation. Four hundred acres of the estate are really outside the borders of the Moss, and these have long been in agricultural use. Thus there are only 200 acres of wild moss remaining in their natural condition, and even these have been drained in places. A good part of them has been planted with trees and made into an excellent cover. Any stray fox might do worse than light on this piece of well-trenched wild land, where he would find a sufficiently mysterious "earth," and, what is of more moment, a plentifully stocked pheasantry.

The estate has been bought for Manchester from sheer necessity. Many thousands of tons of garbage and nightsoil are collected annually that must, from their very character, be disposed of rapidly, cleanly and economically. A large proportion is treated at the Holt Town works, in the north of the city, but there dwellings have been and are being erected rapidly. They are closing round the works, and the cleansing committee some time ago decided that they must look for accommodation elsewhere. Carrington Moss, which, as explained the other day, has been developed by the committee into a fine agricultural property, was made productive almost wholly by the use of this collected refuse, of which, according to a return prepared in 1893, more than 315,000 tons have altogether to be dealt with every year. A proportion of about 20 tons per acre will be still sent annually to Carrington, which contains 1,100 acres. The receptive capacity of mossland in its natural state

is, for some years, practically unlimited, but when brought under cultivation the land must, of course, be treated with some respect for scientific farming. The condition of Chat Moss at present is such that no doubt it will for several years have a receptive capacity for nightsoil of 30 tons per acre annually. On the smaller holdings, which produce immense quantities of vegetable produce of all kinds, the farmers are awaiting the development of the estate by the city authorities. They have now to haul their manure by a slow and expensive process of cartage from one of the nearer railway stations, or along the ten miles of road from the Corporation dépôt at Water Street to their farms. Green vegetables especially cannot be produced as they should be on this land without abundant manure. The root crops need it also. The City Council or the cleansing committee have these immense daily stores of a commodity highly necessary to productive vegetable farming. The farmers absolutely require it, and by the purchase of Chat Moss, together with Carrington, the committee, of which Mr. Richards is the responsible head, appear to have overcome a not inconsiderable difficulty in an effective and economical manner.

Next to the problem of the purchase of the land itself now disposed of must be placed the provision of a means of distribution of removable soil. It scarcely need be written that the carriage of heavy and cumbrous matter of the kind requires careful consideration. As regards conveniences for cheap approach, the situation of Chat Moss is admirable. Its south-eastern boundary reaches close down to the Ship Canal. A little above the Barton Bridge, on the Chat Moss side of the canal, a considerable length of the old river bed, from which, when the canal was made, the Irwell was diverted, has been left open and disused, except as a gathering ground for the surface water from the land near. This old river bed is only divided by the canal bank from the canal itself. On the northern or Moss side of the disused bed the committee have erected a lay-by, or wharf, about 100 yards long. The work has been done in stone, with a good foundation, and when cranes or other hoists have been provided the city will own a serviceable wharf, scarcely more than 100 yards from the Manchester and Liverpool high road. This will be the receiving dépôt for Chat Moss. Water will reach the wharf by the simple expedient of a cutting through the canal bank, and the height of the water at the wharf side will therefore be exactly of the height in the canal. The end of the old bed of the river, of course, will be dammed, and the wharf will actually lie in a dock formed of a portion of the

old bed. This wharf is 7 miles distant from the Corporation yard in Water Street, which also lies alongside the river, and from which the soil will be sent down to the wharf by barge or steamer as is now done at Carrington. The manurial matter having been thus conveyed to the fringe of the Moss, the only remaining question is one of its efficient distribution to the farms. For that purpose a light railway will be constructed under the supervision of the committee. It has been found impossible to obtain the consent of the local authority to a level crossing. A tunnel will be carried under the high road to Liverpool, and the line of the light railway laid thence to the Moss, with junctions from which sections of the line will run to different quarters. These lines will, in fact, be laid in all directions to the length of, perhaps, 20 miles, in order that the branch services of soil may be available for the use of every farmer. The roads which had already been laid, or partially laid, by the leaseholders will be put into sound condition, a work, indeed, with which some progress has been made already. One of these roughly formed roads traverses the Moss from east to west, and it is of good width. It will serve presently as the principal way through the whole estate, by which the farmers will reach the high road with carts containing produce for the city market. All the details of this interesting scheme, under which the Corporation will provide a self-contained light railway system for the whole estate on a principle that has yet only been suggested elsewhere, have been worked out by the sub-committee in whose special charge the Moss has been placed, at the head of which is Mr. Alderman Grantham. Mr. Grantham has spent much time and care on the matter. The financial aspect of the question—as well as the material advantages which will be gained by the city—has been kept in mind. The old leases having in some instances been sold, or bargained away in one or another form, the committee have found it necessary to consider the conditions of each tenancy—there are over fifty tenants—and readjust the rents. They have been partly guided in their decisions by the rates and conditions on other similar property near, and have excellent service done them in this matter and in the general disposition of plans for the improvement of the land and buildings by Mr. R. D. Callison, the head of this department of the Corporation service. The rents, as adjusted, are slightly lower than under the old tenancies. They may be put, roughly, at 2*l.* per acre per annum. The whole amount required for wharves, roads, railways, homesteads, repairs and rolling stock has been estimated by Mr. Callison at 55,000*l.*

WILLIAM HAYWARD & SONS, BRUNSWICK WORKS, BILSTON ROAD, WOLVERHAMPTON.

Ironwork to pattern or order.

Illustrated PRICE LIST on application

VOLUME LVII. OF THE ARCHITECT

Handsomely bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.* Office: 175 Strand, London W.C.

The entire outlay on the 2,600 acres of land will, therefore, scarcely reach 200,000*l.* The Corporation were empowered by the Local Government Board to purchase the estate on terms which would extend the repayment of the money borrowed, principal and interest, over fifty years, and the purchase-money was obtained at 2½ per cent. The cost for a year of the interest and proportion of capital repayable on both the purchase-money and the money to be raised for wharves, roads, railways and other matters is estimated as 5,960*l.* The annual income from the receivable rents is 4,772*l.* 3*s.* 2*d.*, showing a deficit on the amount estimated as necessary for the repayments of 1,187*l.* 16*s.* 10*d.* By this estimate, however, no account is taken of the income from the sale of soil or manure, which will be available for use, practically at the side of the field gates, at about 1*s.* 3*d.* per ton. The cost of sending the manure to, and distributing it on, the estate will be about 1*s.* per ton, and the difference in the cost and the sale price will necessarily prove an addition to the revenue. It has been also estimated that when the light railway has been completed 50,000 tons of night soil may be placed on the land every year. There appears little limit to intensive farming, especially as applied to vegetable culture, and the future of Chat Moss can, therefore, be regarded with equanimity.

Those who, within the past few years, have taken the road which, in an almost straight course, runs from Astley station southward across the Moss to Irlam will perhaps have observed one of the most peculiar of the odd colonies occasionally found in country districts. The spongy, shifting Moss has a depth in places of more than 30 feet. Even where shallow it is the despair of the builder, and the old cottages that stand off the road are wholly of wood, planked together. The sinking of the Moss has curiously twisted them; their floors have had the knack of disappearing and in some instances they are in a deplorably insanitary condition. Even the homesteads built of wood are dwarfed in height, small and unsuitable for their purpose. New houses and cottages of brick, with yards and stabling, are therefore being raised. It has not been thought wise or economical to delve below the Moss and lay the brickwork on solid ground. Short baulks of timber, creosoted, have been laid transversely on the face of the Moss, exactly in the form of a foundation. Above these is a stout beam of oak, laid lengthwise, and on this the brickwork has been raised. If the Moss should sink under any part of the building the task of renewing the bottom range of timber will not be difficult. These homesteads already give an appearance of completeness

to the land which hitherto had been entirely lacking. Their erection was, of course, for a well-ordered community an absolute necessity. A service of drinking water by pipes connected with the Manchester supply has been laid, and the use for household purposes of the brackish water of the Moss or of rain collected by some hasty means is no longer necessary. In the six months that have elapsed since the estate came into the hands of the committee the progress has, in fact, been remarkable, and when the railway lines have been laid and the roads completed another object-lesson in municipal enterprise will be at the city gates.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

19412. Sherdon Schiermann, for "Improvements in blind-rollers."
 19458. Moses James Adams, for "Improvements in valves and fittings for lavatory and other purposes."
 19526. Levi William Crouch, for "Improvements in sash-cord fasteners."
 19542. James Thomas Mason and William Hunter Hardy, for "Improvements in tiles for roofing and like purposes."
 19566. Edward William Hebermaas, for "Improvements in sash-locks."
 19657. Ellas Leak, for "Improved cases or appliances for use in containing or supporting tiles and the like whilst being fixed."
 19705. Friedrich Adolph Hanna, for "An improved closet-seat."
 19753. Charles John Brooke, for "Improvements in fasteners for window-sashes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BATTERSEA.—Sept. 22.—The Vestry of St. Mary offer premiums of 100*l.*, 50*l.* and 25*l.* for the three best designs for the erection of public baths and washhouses. Mr. W. M. Wilkins, Municipal Buildings, Lavender Hill, S.W.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500*l.*, 300*l.* and 200*l.* respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

CARLISLE.—The School Board offer premiums of 20*l.* and 10*l.* for designs for school to accommodate 550 boys. Mr. S. Cartmell, 27 Lowther Street, Carlisle.

DORKING.—Oct. 13.—Plans and estimates are invited for the erection of an infirmary. Mr. George Scales, clerk to the Guardians, High Street, Dorking.

FRINTON-ON-SEA.—Sept. 24.—The School Board invite designs for school to accommodate 150 children and allow of a future extension for 300 children. Mr. A. R. Chamberlayne, Station Road, Clacton-on-Sea.

LEEDS.—Oct. 8.—The Corporation offer premiums of 100*l.*, 50*l.* and 25*l.* for the three best designs for a wholesale dead-meat market and abattoir. City engineer, Municipal Buildings, Leeds.

LOWER BEBINGTON.—Oct. 1.—The Lower Bebington Urban District Council offer premiums of 50*l.*, 35*l.* and 20*l.* for the three best designs for a scheme of sewerage for that portion of their district now being drained into the Bromborough Pool. Mr. Thomas Sproat, 5 Castle Street, Liverpool.

LUDLOW.—Oct. 1.—The Corporation offer a premium of 20*l.* for the best and most economical scheme of electric lighting for the borough. Mr. John Herbert Williams, town clerk, Ludlow.

MERTHYR TYDFIL.—Sept. 30.—The School Board offer a prize of 10*l.* for the best plan of erecting a second floor to the infants' school. Mr. E. Stephens, School Board offices, Merthyr Tydfil.

MORECAMBE.—Oct. 1.—The Urban District Council offer a premium of 100*l.* for the best scheme of an improved and extended sewerage system. Mr. Jno. Bond, surveyor, Morecambe.

SKIPTON.—Sept. 30.—The Skipton and District Cottage Hospital committee offer premiums of 15*l.* and 5*l.* for the best designs for a cottage hospital, at a cost of 2,500*l.* Mr. W. H. Dawson, hon. sec., Skipton.

UXBRIDGE.—Oct. 30.—The Uxbridge Rural District Council invite plans for a scheme of sewerage and sewage disposal. Mr. Charles Woodbridge, 138 High Street, Uxbridge.

CONTRACTS OPEN.

ACTON.—Sept. 23.—For additions to Board school. Mr. Edward Monson, architect, Acton Vale, W.

ARUNDEL.—Sept. 20.—For building labourers' cottages on the Duke of Norfolk's estate. Mr. Heveningham, Estate Building Office, Arundel.

AULT HUCKNALL.—Sept. 24.—For building school, &c. Messrs. Rollinson & Sons, architects, 13 Corporation Street, Chesterfield.

BASFORD.—Sept. 20.—For construction and maintenance of stoneware pipe sewers. Mr. H. Walker, Newcastle Chambers, Nottingham.

BATH.—Sept. 21.—For erection of a steam laundry, stables, &c., at Twerton. Mr. Ernest J. White, Northgate Chambers, Bath.

BIRKENHEAD.—For erection of proposed mortuary. Mr. Joseph Young, surveyor, 78 Stanley Terrace, New Ferry, near Birkenhead.

BLETCHINGLEY.—Sept. 22.—For enlargement and alteration of the workhouse. Mr. Frederick Elliff, architect, Caterham, Surrey.

BOOTLE.—Sept. 30.—For building school. Messrs. Cox & Marmon, architects, 11 Dale Street, Liverpool.

BOVEY TRACEY.—Sept. 25.—For erection of a school building at Heathfield. Messrs. J. W. Rowell & Son, architects, Newton Abbot.

BRADFORD.—Sept. 20.—For erection of business premises in Ivegate. Mr. J. Ledingham, District Bank Chambers, Bradford.

BRADFORD.—Sept. 28.—For building seven houses and house and shop. Mr. Samuel Robinson, architect, 15 Cheapside, Bradford.

BRENTWOOD.—Oct. 2.—For erection of a boiler-house and extension of the clerk's offices at the asylum. The Medical Superintendent, Asylum, Brentwood.

BRISTOL.—Sept. 20.—For erection of schools, Ashley Down, Horfield. Messrs. Walter S. Paul & James, architects, 15 Clare Street.

BRISTOL.—Sept. 18.—For building schools. Mr. J. A. Beynon, architect, Coleford, near Bath.

ARCHITECTS PLEASE NOTE.

PATENT.

The "Waterwitch" Cistern is now fixed and in operation at the

HOTEL COBURG, LONDON.

A leading Architect says of this Cistern, "I was struck with its simple and noiseless action."

CHEAP BUT EFFICIENT IN ACTION.

THE VALVELESS SYPHON CO., KIRKSTALL, LEEDS.

BURNLEY.—Sept. 29.—For erection of a memorial fountain, Queen's Park. Borough surveyor, Town Hall, Burnley.

CAMBERWELL.—For erection of a pair of semi-detached villas in Benhill Road. Mr. S. Evans, architect, 36 Heron Road, Herne Hill, S.E.

CASTLEFORD.—Sept. 21.—For alterations and additions to dwelling-house and shops, Carlton Street. Mr. Arthur Hartley, architect, Carlton Chambers, Castleford.

CASTLEFORD.—Sept. 23.—For erection of a cart-shed in Wheldale Lane. Mr. W. Green, surveyor, Council Offices, Castleford.

CRAMLINGTON.—Sept. 22.—For erecting a dwelling-house. Messrs. Boulds & Hardy, architects, Market Place, Morpeth.

CHADWELL HEATH.—Sept. 28.—For building foundations, lodges, &c., in connection with lunatic asylum. Mr. Lewis Angell, Town Hall, Stratford.

CORNWALL.—Sept. 22.—For erection of a residence on a site situate between Port Isaac and Port Gaverne, Cornwall. Messrs. Wise & Wise, architects, Launceston.

DOUGLAS.—Oct. 2.—For constructing brick and stoneware pipe sewers. Messrs. Stevenson & Burstal, 38 Parliament Street, Westminster.

EBCHESTER.—Sept. 25.—For erection of sixteen houses. Hamsterley Colliery Offices, Ebchester, R.S.O.

ERDINGTON.—Sept. 29.—For making roads. Mr. H. H. Humphries, Public Hall, Erdington, near Birmingham.

FEATHERSTONE.—Sept. 24.—For erection of boundary walls, laying-out walks, and grounds required in the addition of one acre of land to the Featherstone Cemetery. Mr. W. Hamilton Fearnley, architect, Station Lane, Featherstone.

FORRES.—Sept. 27.—For additions to hydropathic establishment. Mr. John Forrest, architect, 129 High Street, Forres, N.B.

GATESHEAD.—Sept. 21.—For rebuilding the boundary wall and henhouse at the workhouse for the Guardians. Mr. George Craighill, clerk, Poor Law Union Offices, Prince Consort Road, Gateshead.

GLOUCESTER.—Sept. 25.—For laying stoneware pipe sewers, with manholes, ventilators, &c. Mr. J. F. Trew, County Chambers, Gloucester.

GREAT YARMOUTH.—Sept. 25.—For erection of two houses, Wellesley Road. Mr. Chas. G. Baker, architect, Town Hall Chambers, Great Yarmouth.

HALIFAX.—Sept. 29.—For building dwelling-house. Messrs. C. F. L. Horsfall & Son, architects, Lord Street Chambers, Halifax.

HALIFAX.—Oct. 4.—For erection of a drapery warehouse and offices in Rawson and Powell Streets. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

HARPENDEN.—Sept. 29.—For erection of police station. Mr. Urban A. Smith, county surveyor, 41 Parliament Street, S.W.

HARROGATE.—Sept. 22.—For erection of a residence, Park Drive. Messrs. S. E. Smith & J. Tweedale, architects, 12 South Parade, Leeds.

HEXHAM-ON-TYNE.—For building square chimney 75 feet high. Messrs. John Fenwick & Sons, Hexham-on-Tyne.

HOLBEACH.—For erection of public hall, for the Holbeach Public Hall Company, Limited. Mr. Joseph Sawyer, 63 Chancery Lane, London, W.C.

IRELAND.—Oct. 4.—For erection of a stationmaster's office at the passenger station, Banbridge, and for alterations to the station; also construction and erection of platform roofs at Banbridge and at Clones, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

KIRKLEATHAM.—Sept. 24.—For building reading-room. Mr. E. A. Whipham, architect, 59 High Street, Stockton-on-Tees.

LAMBETH.—Sept. 20.—For construction of a movable wooden floor and platform for entertainment purposes over the pond of first-class swimming-bath. Mr. A. Hessel Tiltman, 6 John Street, Bedford Row, W.C.

LAMBETH.—Sept. 21.—For erecting new camp sheathing at Letts Wharf. Engineer to the Commission of Sewers, Guildhall, E.C.

LEEDS.—Sept. 20.—For building warehouse, &c. Mr. T. Winn, architect, 70 Albion Street, Leeds.

LEEDS.—For extension of mill premises, East Street. Messrs. Ambler & Bowman, architects, 9 Park Place, Leeds.

LEWISHAM.—Sept. 27.—For erection of lunatic wards at the infirmary, High Street. Mr. Robert Williams, architect, 17 Effingham Road, Lee, S.E.

LEWISHAM.—Sept. 21.—For building fire brigade station. Architect's Department, London County Council, Spring Gardens, S.W.

READING CASES FOR THE ARCHITECT
Price 2s. Office: 175 Strand London, W.C.

TUNBRIDGE WELLS.—Sept. 27.—For enlargement of boiler-house at Pembury, four miles from Tonbridge and Tunbridge Wells Stations. Mr. T. E. W. Mellor, Town Hall, Tunbridge Wells.

WALES.—Sept. 27.—For erecting a chapel at Pencoed. Rev. Stephen Jones, Coychurch, Bridgend.

WALES.—Oct. 1.—For erection of police station buildings, with cells and petty sessions court, at Redditch. Mr. Henry Rowe, county surveyor, Worcester.

WALES.—Sept. 20.—For erection of mixed schools at Resolven for 528 children. Mr. J. Cook Rees, architect, St. Thomas Chambers, Church Place, Neath.

WALSALL.—Sept. 25.—For constructing earthenware pipe sewer. Mr. John R. Cooper, town clerk, Walsall.

WESTBURY-ON-SEVERN AND DYMOCK.—Sept. 25.—For building police-stations. Mr. M. H. Medland, architect, 15 Clarence Street, Gloucester.

WARRINGTON.—Sept. 20.—For erection of county asylum on the Winwick Hall Estate, Winwick, near Warrington. Mr. Fred. C. Hulton, clerk, County Offices, Preston.

WHITEHAVEN.—Sept. 21.—For rebuilding house. Messrs. Moffatt & Bentley, architects, Whitehaven.

WILTON.—Sept. 20.—For building a laundry and other work in connection therewith at the workhouse. Messrs. John Harding & Son, 51 Canal, Salisbury.

YORK.—Sept. 29.—For widening and laying-down railway. Mr. C. N. Wilkinson, North-Eastern Railway Company, York.

In view of the experiment to be made with the trolley system of electric traction on the Springburn section of the Glasgow Corporation tramway system, a new type of car is in course of construction at Coplawhill. In front it will have a platform for the conductor. Then will follow a compartment similar to that of the car in ordinary use. At the rear of it will be a footboard forming a platform, which will separate the closed part of the car from a section which will have open sides, a covered top and bulkheads fore and aft. This will form a smoking-compartment, which can be open in summer and closed in winter. At the rear end of the car will be another platform for those who wish to smoke in the open air. There will be no seats on the top of the car, so that the difficulties in regard to low bridges will be obviated.

TENDERS.

ABERDEEN.

For the construction of pipe sewers, with ventilating manholes, &c., in Burns Road and Forest Avenue. Mr. WILLIAM DYACK, burgh surveyor.

Burns Road.

UNEQUALLED FOR ALL DECORATIVE PURPOSES

Aspinall's

ENAMEL

For Inside and Outside Work.

READY FOR USE.

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

ASPINALL'S ENAMEL can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special
"DECORATOR'S" ENAMEL.

ASPINALL'S ENAMEL. LTD., NEW CROSS, LONDON, S.E.

MR. ZACHARY MELLOR, the town clerk of Rochdale, died suddenly on the morning of the 13th inst. He had reached the venerable age of seventy-eight, but some years ago his health began to decline, and the Corporation appointed Mr. James Leach to act as his deputy. For the last few years he has not been required to take any active part in the work, but was occasionally consulted on important matters.

VESTIBULE, HER MAJESTY'S THEATRE, HAYMARKET.

GRAND STAIRCASE, IMPERIAL INSTITUTE.

BUILDING AND BUILDERS.

THE foundation-stone of a new cathedral in Loughrea, co. Galway, is expected to be laid on October 2; the building is estimated to cost 13,000*l*.

A SITE has been purchased in Seascale for the erection of a large hotel.

A SECOND scheme for the Cheltenham kursaal has been issued. The cost would be 26,000*l*. instead of 60,000*l*.

THE Sheerness School Board have purchased a piece of land from the War Department for 2,000*l*., on which to build a new school.

THE chapel in Nelson Street, Newcastle-on-Tyne, First Circuit, has been sold for 7,500*l*., and a new chapel and premises are to be erected in Northumberland Road, at a cost of 15,000*l*.

SEVEN tenders have been received for the restoration of Brierley Hill Church; the lowest was 6,797*l*., a sum far beyond what the committee had expected. It was anticipated that the work could be carried out for from 3,000*l*. to 3,500*l*., and Mr. John Corbett engaged to provide half of the estimated outlay.

A BREACH has been made in the North Pier, Tynemouth, and the advice of Sir J. Wolfe Barry, C.E., and Mr. C. E. Matthews is to rebuild the pier from the breach seaward, at an estimated cost of 302,000*l*. The piers had just been finished when the misfortune happened. The River Tyne commissioners have practically adopted the report of the experts.

THE plans of the new church at Handforth have been passed, and it is expected that the work of building will be entered upon in the course of the next few weeks. The new edifice is to be erected on land near the present structure.

A NEW theatre is to be erected in Hanley by Messrs. Elphinstone. The tender of Mr. T. Godwin, Hanley, has been accepted. The amount of the contract is 13,000*l*. The

site selected is at the junction of Foundry Street and Trinity Street. Mr. Matcham, of London, is the architect. The stage is to be so constructed that it can be removed at any time if necessary.

THE Clothworkers' Company have granted money for the purchase of a site in order that an extension of the Yorkshire College in Leeds can be constructed. The new buildings will comprise a main wing and corridor fronting College Road. The ground floor will be a large room for woollen-yarn making, and rooms for beaming, &c. On the first floor will be situate a room for the worsted department, research or conditioning laboratory and office.

THE contract for the construction of the Midland Railway Company's new deep-water harbour and pier at Heysham, in Morecambe Bay, has been secured by Messrs. Price & Wills, 15 Great George Street, Westminster, S.W., who have in hand the Sheffield District Railway. The railway from Morecambe to Heysham is now making good progress, the contractors being Messrs. Godfrey & Liddelow, of Morecambe. The construction of the entire works, which are naturally of a very extensive character, is likely to extend over a period of three to four years.

THE contract for excavating the foundations of the old Tombs Prison in New York City was let recently to a Mr. Cody. It was supposed that the foundations rested on piles rotted by age, and would need special machinery for their removal. He found, however, there was a platform, laid horizontally along the foundations, of huge hand-hewed logs of white pine three tiers deep, measuring 30 feet in length and 11.4 inches square. The big beams are in perfect condition. It is likely that the timber will be worth about 10,000*l*.

BUILDERS and investors in land would do well to attend the land sale at Hayling Island on the 24th inst., when in addition to the beautiful residence of Westfield, with stabling and grounds of 4½ acres, in a lot by itself, there will be offered several half-acre plots on the Sea Common at South Hayling, which may be paid for on the instalment plan, with free conveyances, so that private gentlemen, builders and speculators generally may become owners of freehold on moderate terms and reap the benefit of increased values in the immediate future. The new steam ferry at Cumberland Fort will render this charming seaside resort a suburb of Southsea. Lumleys, of St. James's House, are the London auctioneers, and King & King, of Portsea, are local agents.

THE foundation-stone of the new church of St. Ambrose, Pershore Road, Edgbaston, which is to replace the temporary church in which public worship has been conducted for some years, was laid on the 13th inst. The site has been given by Lord Calthorpe, and the cost of the new building will be between 6,000*l.* and 7,000*l.* It will be erected of red brick, with terracotta dressings upon the outside, and Bath stone dressings in the interior. There will be a nave 90 feet long, a chancel 36 feet long, north and south aisles, north and south transepts, a choir vestry with organ-chamber over, clergy vestry, and an apsidal projection at the west end forming a baptistery. A tower and spire 150 feet in height will be added at the north-west corner, and also a south porch, but only a portion of the tower is to be erected at present. Seating accommodation will be provided for 708 worshippers.

TRADE NOTES.

THE churches of Hampton Lovett, near Droitwich, and Kirk Ella, near Hull, have just been successfully lighted by means of the "Cathedral" lamp supplied by Messrs. Jones & Willis, of Birmingham and London. Messrs. Jones & Willis also executed the reredos for the new church of St. Luke, Maidstone, of which Mr. Seth-Smith is architect.

THE Bangor County School, Bangor, North Wales, is being warmed and ventilated by means of Shorland's patent Manchester grates and special inlet panels.

MESSRS. WYLIE & LOCHHEAD, upholsterers, were entrusted with the furnishing and decoration of the reception-room and retiring-rooms specially assigned for the use of the Duke and Duchess of York at the City Chambers, as also the reception-room in the New Art Galleries.

MESSRS. MORRISON, INGRAM & CO., LIMITED, Hygeia Works, Cornbrook, Manchester, announce that they have converted into a private limited company their business and the business of Messrs. Staley Bros., Midway Pottery, Staffordshire (with whom they are amalgamated), with the object of re-modelling and extending Midway pottery, building increased foundries, sanitary engineering workshops and sanitary pottery works upon land recently acquired, amounting to upwards of 8 acres in extent, in Trafford Park, situated near the Manchester Docks. The title of the company will be Morrison, Ingram & Co., Limited.

MESSRS. S. B. BOLAS & CO. have been awarded the bronze medal for their exhibit of photographs at the Falmouth Exhibition.

VARIETIES.

IN reply to "R. W. K." :—1. Heaton, Butler & Bayne, Garrick Street, London. 2. Lavers, Westlake & Co., Endell Street, London. 3. A. Gibbs & Co., Bloomsbury Street, London.

THE Old Deer Park, containing about 90 acres, is likely to be acquired by the Richmond Town Council.

THE Earl of Carlisle is about to dispose of a large portion of his Manor Park estate at Hampton-on-Thames.

MR. W. H. WAGSTAFF, 57 Saltergate, Chesterfield, has been instructed to report as to the best means of sewage disposal at Bolsover, near Chesterfield.

A TABLET is to be erected to the memory of the Rev. A. M. Toplady, the author of "Rock of Ages," in the Devonshire church in which he formerly ministered.

A SITE in Crown Street has now been definitely decided on for the new Aberdeen Post Office. The price at which it is to be purchased is 13,000*l.*

THE treasurers have received from "A Friend of the Dean" a donation of 500*l.* towards the restoration of the west front of Peterborough Cathedral.

THERE is but one church in the Gower peninsula, West Glamorgan, that is unrestored, and that church, Llanrhidian, is removing the reproach. It is an interesting and ancient church of the fourteenth century, and is undergoing very careful restoration.

THE Grand Duke of Hesse has placed at the disposal of the Emperor of Russia an extensive site on the so-called Matilde Höhe, on which the Emperor intends to erect at his own expense a chapel of the Orthodox Church, the construction of which will be commenced next spring.

The Prince of Wales has accepted an invitation to pay a visit to Stanmerham, Sussex, next month to lay the foundation-stone of Christ's Hospital (Blue Coat School). An application has been made to his Royal Highness to leave the train at Horsham, receive an address and drive through the town on the way to the site selected for the new school.

THE restoration of the ancient parish church of Wilmslow has now been taken in hand, and it is expected to cost nearly 2,000*l.*

ONLY ADDRESS—CABINET MAKERS, UPHOLSTERERS & DECORATORS, ONLY ADDRESS—

151, 152, 153, 154 & 155 CURTAIN ROAD, LONDON, E.C.

THE Dewsbury Town Council have investigated charges which had been made by Councillor Wilkinson against Mr. Whitworth, superintendent of the Corporation depôt in George Street, of having accepted bribes for placing orders with a local firm of tradesmen. The Council found there was no foundation for the charges, and called upon Mr. Wilkinson to resign his position on the general works committee.

OWING to the increase in the numbers at Mill Hill School, it has been found necessary to provide further accommodation for the boys. The additional premises are in course of alteration, and will be available for use next term. The Governors are also erecting a number of new studies for senior boys, and extensive chemical and physical laboratories with a large lecture-room. A large schoolroom, to accommodate 250 boys, and the new chapel will be ready early next year.

SEVERAL workmen were engaged in excavating under some old and dilapidated outbuildings on a farm at the village of Orton Longueville, near Peterborough, when they came across a well-made floor about 6 feet below the level, which is entirely constructed of knuckle bones, supposed to be those of sheep and cattle. It is estimated that the singular work is at least 150 years old.

THE School of Art Wood-carving, Central Technical College, Exhibition Road, South Kensington, has been reopened after the usual summer vacation. One or two of the free studentships maintained by means of funds granted to the school by the City and Guilds Institute are vacant. To bring the benefits of the school within the reach of artisans, a remission of half fees for the evening class is made to artisan students connected with the wood-carving trade. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

ELECTRIC NOTES.

SEVERAL companies have notified their intention to apply for Parliamentary powers for lighting the borough of Lewes by electricity, and have asked for the consent of the Corporation. The Gas Company have also made a request for the Corporation to obtain a provisional order and transfer it to them, the company paying all costs. Owing, no doubt, to the success of the municipal electricity supply undertaking of the adjoining borough of Brighton, the Corporation have been fully discussing the matter, and consider it advisable to obtain expert

assistance. They have therefore decided to consult Mr. F. J. Warden-Stevens, of Westminster.

THE SANITARY INSTITUTE HEALTH EXHIBITION.

THE exhibition which is being held in Camp Road, Leeds, in connection with the Sanitary Congress now in progress, was opened on Tuesday evening by the Lord Mayor in the presence of a large assemblage of leading members of the Institute, sanitarians from various Yorkshire centres and members of the Leeds Corporation, the Yorkshire Ladies' Council of Education and other bodies interested in questions affecting the public health. The proceedings took place in the centre of the great edifice, where an elegantly decorated platform had been specially erected.

The exhibits, of which there are 145, exclusive of the loan collection, are widely comprehensive, embracing as they do in their respective classes (1) building materials and sanitary apparatus; (2) water-supply and sewerage; (3) heating, lighting and ventilating; and (4) personal and domestic hygiene. It is with the first three of the above-named classes that we are principally interested, and among the exhibits in these is a new form of water-closet which possesses in a marked manner many advantages over the existing ones. This new departure, invented by a well-known Liverpool architect, is on exhibition on Messrs. Doulton & Co.'s stall. The closet, which does away with the disadvantages of the present system of flushing, being self-contained, self-acting, silent, simple and absolutely impervious to injury by frost, is to all appearances nothing more than a neat-looking closed cabinet. The usual unsightly open pan, with its ugly cistern and pipes, are conspicuous by their absence, pulls, chains, levers, cranks and syphons being also entirely dispensed with. A water-retainer is placed within a casing behind the water-closet, and the flushing apparatus is worked by the mere raising and closing of the closet lid, which when put down causes the flush to take place, alike unseen and practically unheard, emptying the retainer and pipes thereto, whilst the mere raising of the lid for use again fills the retainer for the flush which follows immediately on its being closed. Frost, even of the severest, cannot damage the apparatus, which effects thereby a saving in plumbers' bills and attendant inconveniences. The closet is known by the name of the O.B. closet, and has already passed successfully the stringent tests of the Liverpool Corporation.

EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,
LONDON. N.W.

Messrs. Wm. Woollams & Co., of 110 High Street (near Manchester Square), W., show a handsome assortment of their wall papers, free from arsenic; examples of early Victorian and modern wall papers, highly arsenical; set of test tubes, showing arsenical mirrors obtained in testing the above-named arsenical papers; set of test tubes, showing results of testing wall-papers free from arsenic; test tubes, showing result of blank experiment, with pure reagents prior to testing the above, &c.

Messrs. Shanks & Co., Tubal Works, Barrhead, have a comprehensive show of their baths and water-closets, most of which we referred to at some length in connection with the Building Trades Exhibition.

Messrs. Claughton Bros., Bramley, Leeds, send specimens of water-closets, sanitary lead goods, junctions, lead traps, soil pipe terminals, fastenings for lead pipes, such as sockets, clips, tacks, &c., ornamental lead work, rain-water heads, gutters, &c.

Mr. George Jennings, Lambeth, is represented by his rolled edge porcelain bath, fitted with new "Duplex" supply and sanitary waste valves, arranged for public baths; special broad rolled rim iron bath, fitted with new "Duplex" supply and sanitary waste valves, arranged for asylums; rolled edge porcelain bath, fitted with new "Duplex" supply and sanitary waste valves, arranged for private use; cabinet stands fitted with new "Duplex" supply and sanitary waste valves; tip lavatory, fitted in wooden enclosure; strong porcelain lavatory, for schools, &c.; fold-up railway lavatory with patent counter-balanced porcelain tip-up basin, receiver and soap dish, polished walnut moulded casing; syphonic closet, working with waste preventing after flush, regulating supply valve, and variations; concealed urinal in mahogany casing for billiard rooms, &c.

Messrs. Adams & Co., Park Lane Works, Leeds, show examples of urinals and urinal flushing, multiple and single closets, flushing apparatus, sewage ironwork, patent sewage lift, lavatory basins, &c.

The Cordelova Co., Limited, 74 Pitt Street, Edinburgh, have an interesting display of their new material "Cordelova" for wall and ceiling decoration, consisting of dados, friezes, fillings and ceilings in relief.

Messrs. W. Summerscales & Sons, Limited, Phoenix Foundry, Keighley, Yorks, attract much attention with their washing, boiling, rinsing and disinfecting machine. The machine is made entirely of metal, the outer shell of mild steel, the inner revolving drum being of brass perforated. The inner revolving drum is fitted with a patented automatic reversing

motion and locking gear, very effective in operation. The outer shell is provided with a steam-tight door, so that all clothes treated may be boiled under steam pressure, ensuring thorough disinfection. The machine is thus particularly adapted for public-institution work and where infected linen may require to be dealt with, and their Cheltenham ironing flue for heating flat-irons and drying purposes is also shown. The special advantages this flue possesses are the small consumption of fuel, perfect control of fire, thorough cleanliness, the ashes falling into an enclosed chamber, improved method of cleaning grate bars, great durability.

The Blackman Ventilating Company, 63 Fore Street, London, E.C., show a Blackman fan, 30 inches diameter, fitted with motor direct, coupled to drive by electric current, shown in operation; and one 36 inches diameter, for driving by belt, not in operation. They also show their special screen for cleansing air for ventilating purposes, and which may also be moistened for disinfecting, deodorising or perfuming the air, which is shown in operation.

The exhibit of the Expanded Metal Company, Limited, 39 Upper Thames Street, E.C., is practically similar to that which we described at the exhibition at the Agricultural Hall, comprising as it does the now well-known specialties of the firm in expanded metal (Golding's patent); floors and suspended ceilings; solid fireproof partitions; concrete channel iron arch floor; various specimens of expanded metal fencing, tree guards, bowers and other horticultural articles; specimens of expanded brass goods, copper, aluminium, &c.; expanded metal sewage strainer; and their rotary washing machine.

Mr. William Gooding's (North Road Works, Islington, N.) patent interchangeable rubber stair treads are *en evidence*, together with his patent combined safety valve and fusible plug.

Kendall's Patent Reversible Window Sash Company, Limited, manufacturers, 69 Bath Row, Birmingham, show their patent reversible window sashes and casements, which are cleaned from the inside, and the Eagle Range Company have their usual interesting and comprehensive display of ranges and firegrates, the advantages of which are too well known now to need any particularisation.

We shall give further particulars next week of some of the principal exhibits, amongst which we may mention those of Day's Automatic Closet Co., the Leeds Art Pottery and Tile Co., the Farnley Iron Co., the Valveless Syphon Co., Oates & Green, Jas. Milne & Son, and S. Dixon & Son.

NEW CATALOGUE.

MESSRS. J. H. SANKEY & SON, of Canning Town, are issuing a new illustrated catalogue, which is replete with information as to the firm's specialties, which comprise every variety of fire-bricks, boiler heating blocks, boiler flue covers, boiler fronts, fireballs, gannister, silica sand, crucibles, muffles, tuyers, runners, fireclays, &c. Sections and dimensions are given, and users will find the book very useful for easy reference. Messrs. Sankey & Son invite special attention to their patent deep intercepting gully, for which they claim the following advantages. Drains cannot block or sewer-gas escape where these gullies are used; effectual trapping, great depth of water always above outlet, gases from drain absolutely prevented from escaping into gully; gully does not unseal in the dry weather; specially constructed iron bucket, with long handle; water has to pass through perforations in bucket; all solid matter, such as stones, wood, grease, straw, &c., are intercepted and collected; bucket can be easily removed and emptied at any time without untrapping gully; the inspection-cap allows access to drain for clearing purposes; gullies being made of glazed vitreous stoneware are sanitary and indestructible.

NATIONAL ASSOCIATION OF MASTER BUILDERS.

THE following circular has been issued by the National Association of Master Builders of Great Britain:—

"The strike of plasterers in Liverpool, which commenced on May 1 last, still continues, and is being prolonged through the men on strike being employed by other contractors throughout the country, and I am instructed to write and ask if you will kindly request the members of your Association to refrain from employing these men during the dispute. The master plasterers are contending against the full strength of the National Association of Operative Plasterers, and it is an open secret that, if they are defeated, the operatives in the other branches of the building trade in Liverpool intend to make similar claims which include:—

- (1) Limitation in the number of apprentices.
- (2) The right of their delegates to visit all works to converse with the men.
- (3) Railway fares in and out to country jobs weekly.
- (4) That none other than plasterers do concrete flooring, floating for wood blocks and tiles and lathing.
- (5) The privilege of working overtime, when insisted upon by the men, to be paid time and a quarter, and several other similar unreasonable demands.

"If the trades union is successful in Liverpool these claims will, no doubt, be made in other towns. The officials have declined arbitration, and intimated that the operatives will not return to work until the whole of the demands are conceded.

"I am also instructed to ask you to call the attention of the members of your Association to the resolution which was unanimously passed at the recent meeting of the National Master Builders' Association, at Bristol, enforcing the necessity of all employers increasing the number of their apprentices in order to remove the present inconvenient scarcity of labour.—Yours faithfully, J. ALFRED S. HASSAL, Secretary.

P.S.—In taking on any plasterers during the present dispute my Association would suggest that full inquiries be made as to where they were last employed.

PATENT VICTORIA STONE.

THIS material has been far too long familiar to architects, builders, contractors and those engaged in public works to render any dilatation on its merits in the least degree necessary. A material which has stood the test of some thirty years' use, and that under the most exacting conditions, can require no further or other recommendation. Having been used for the paving of the northern approach to London Bridge for the last ten years and of the southern approach to Blackfriars Bridge for nearly thrice as long a period, Victoria stone is quite outside the pale of criticism and altogether *hors de concours*.

Within the last year or so, however, the Patent Victoria Stone Company have enlarged their field of operations by showing that the stone is as adaptable to, or rather as suitable for, ornamental as it has long been shown to be for utilitarian purposes. In other words, that the stone may be moulded or carved—or both—in any design and to suit any purpose, and can be produced in any colour, making it possible therefore to match any natural stone. Thus the same material which is the paving of a nobleman's stable may be employed for a delicately carved pedestal in his library or the more boldly sculptured pillars of his park gates.

Proof of this adaptability is clearly shown at the exhibit of the company at the Victorian Era exhibition at Earl's Court. Here—in that part of the building which is known as the Ducal Hall—the stone is presented in several ornamental forms, chief among them being a large window frame, which has been designed by Messrs. Leeming & Leeming, and carved

HOLLIS BROTHERS & CO., LEICESTER.

by Mr. C. H. Mabey, of which we publish an illustration. The design, which has been most admirably executed, is in the Renaissance style, and is specially noteworthy for its restraint,

for while replete with artistic charm it has the further merit of not being overloaded with detail.

There is also at the stand a handsome panel which has

been designed to commemorate the Diamond Jubilee. This also is the work of Mr. Mabey. The centre bears a medallion portrait of the Queen, supported by winged and unwreathed cherubs, and, although the head is perhaps a trifle too large, the whole has a very good effect.

The same sculptor is responsible for two finely cast vases. They are in coloured stone, and being artistically cast have a very handsome appearance.

At the stand there are two carved panels, mention of which must not be omitted. One is in coloured stone, and bears as the design a central shield supported by cornucopie and florid ornamentation; the other is of plain stone, and in that which we believe is called the Neo-Grec style. The design is of a somewhat florid character, but this is tempered by a central *patra* or boss, and other severe details. These panels are very good, especially as showing two different but equally effective styles.

Very clever, both in idea and execution, is that which may be called the company's panel. At each end is a cherub, the one blowing a trumpet and the other with hand outstretched, both thus presumably, though perhaps unnecessarily, directing attention to the words "Victoria Stone," which are chiselled on a tablet in the centre of the panel.

The company also exhibit samples of their Patent Opalite Tiling, which would lend themselves very admirably to purposes of ornamentation. The enamel is very brilliant, as are the colours, the purity of the white and a particularly fine blue being specially noticeable. There are also bricks which have been similarly prepared.

Finally, and as showing that the stone is adaptable to useful as well as to ornamental purposes, the company exhibit a sink with rebated hole for the trap, stair treads, two fluted pedestals, a very handsome balustrade for a garden terrace and other things, the whole forming a display which not only comprises objects of great artistic merit, but is as a whole most imposing and attractive, and sets forth in a very clear and striking manner the admirable adaptability of the patent Victoria Stone to purposes of ornament as well as usefulness.

The stone used for ornamental purposes by the Victoria Stone Co. is prepared and manufactured by the same process as that used so successfully by the firm for the variety of heavy work for which this stone has been supplied during the past 30 years, the only difference being that the work now exhibited is of a much finer grain, and therefore more easily lends itself to the carver's artistic treatment.

TEMPORARY ACCOMMODATION FOR WORKMEN.

THE great influx of workmen, chiefly navvies, into Epsom, owing to the erection of the new asylum for the London County Council on the Horton Manor estate, is causing some concern to the local authorities. There being insufficient lodging accommodation in the town many of the men sought shelter at the workhouse, but not being destitute, they could not be treated as paupers or casuals. Some tents have been erected in contravention of the by-laws, and a great number of men are reported to be sleeping in the open air and finding shelter wherever they can. The men have, however, given the police little or no trouble. Two meetings have been held by the Epsom Urban Council to consider the question with a view to taking action under the Housing of the Working Classes Act, and the Council have drawn up a scheme which, if carried out, would involve the borrowing of 7,500*l.* for the erection of fifty cottages (estimated to accommodate 500 men) on their own land. It is calculated that the rents derived from these cottages would yield an annual profit of 100*l.*, after allowing for the repayment of instalments of borrowed money with interest. The carrying out of this scheme depends upon any action which the London County Council may take to meet the difficulty, and the Epsom Council are in correspondence with that body on the subject. They have received an intimation that the asylums sub-committee have instructed the architect to communicate with the contractors. The need of accommodation will be felt still more after Christmas, when, it is stated, 1,600 men will be engaged on the work, chiefly carpenters and bricklayers.

WIRELESS TELEGRAPHY.

THE honour of being the earliest discoverer of wireless telegraphy is claimed by the *Dundee Advertiser* for Mr. James Bowman Lindsay, a teacher of science, who died in Dundee in 1862. According to our contemporary Mr. Lindsay conceived the idea of telegraphing without wires as early as 1831, and actually carried it into practice successfully in 1857. In the latter year he made experiments in the presence of several local scientific men at Earl Grey Dock, Dundee, and succeeded in sending messages from one side of the dock to the other. He dispensed with wires, using the water as his communicating medium. Mr. Lindsay afterwards extended the plan of his

experiments. He placed his plates and batteries on each side of the Tay, at Dundee and Woodhaven, where the river is nearly two miles wide, and here also he succeeded in sending messages from one side to the other without wires. In 1859 he read a paper on the subject of his theory before the British Association at Aberdeen, and at the same time conducted a further series of experiments at the Aberdeen Docks to demonstrate its correctness. Mr. Lindsay entertained great hopes of his system being used for telegraphing over much longer distances, for he made calculations to show that, by selecting two stations in Britain—one in Cornwall and the other in Scotland—and two corresponding stations well chosen in America, it would be possible to transmit messages across the Atlantic without employing cables. Although Mr. Lindsay's experiments aroused a good deal of discussion forty years ago, nothing was done to apply his theories to practice, and he himself died only a few years later in circumstances bordering on penury.

MR. F. S. PERCIVAL, of Portmadoc, South Carnarvonshire, has undertaken the erection of a choir and clergy vestry for St. John's Church in that town. The church will then only require a tower to be complete.

HORSES first, but not horses alone, were the attraction at the very successful Dublin Horse Show this year, and lady visitors to the familiar grounds at Ball's Bridge were much interested in the exhibits in the galleries. Many of these were very admirable, one of the most important and attractive being the display of artistic and inexpensive furniture made by the firm of Oetzmänn & Co., of Hampstead Road, London, whose Irish branch is at 61 Grafton Street, Dublin. Amongst other items Messrs. Oetzmänn exhibited a delightful cosy corner of white enamelled wood richly upholstered in pink silk, and yet quite inexpensive; a Sheraton writing-table of inlaid mahogany; a very handsome 7 feet high china cabinet of mahogany delicately inlaid; a newly-designed easy chair, upholstered in rich vieux rose silk; and one of their stained green wood bedroom suites, fashionable and liked for their extremely moderate price and quaint prettiness of design. Messrs. Oetzmänn's exhibit will doubtless tempt the Dublin ladies who saw it to extend their acquaintance with the firm's inexpensive productions, by paying a visit to their showrooms at 61 Grafton Street.

RAILWAY BRIDGES AND ABNORMAL LOADS.

A RATHER extraordinary state of things has arisen at Round Oak, Staffordshire, owing to the refusal of the Great Western Railway Company to allow the passage over one of their bridges of a casting about 43 tons in weight, borne on a carriage which increases the load by about 5 tons. The casting comes from the dismantled works of the New British Iron Company, and was on its way by a somewhat circuitous route to the Old Level Iron Works. When the former works were sold under the hammer the original purchaser of the casting sacrificed his purchase owing to the great difficulty of transporting such an enormous weight, and it was subsequently bought by the present owner for the purpose of being used at the Level Works. All went well with the transport of the casting till about a month ago, when it neared the railway bridge in question. The railway officials peremptorily declined to let it pass owing to the risk to the bridge that might be incurred, and they contended that it could not be said to come under the definition of the ordinary traffic of the district for which alone they have to provide bridges of sufficient strength. The contractors for the removal, however, hold that in an iron-making district it is the duty of the railway company to provide for the passage of weights as heavy as that referred to, though they may only rarely pass along the highway. The propping of the bridge while the casting passes would, it is understood, lead to some interruption of traffic. There was an idea among the railway officials that one night an attempt would be made to risk the passage of the bridge, and to the surprise of the public, a trench was found cut across the road, but this was subsequently levelled again. Meanwhile the casting has to be specially guarded in order to avoid accidents. While the railway company refuse to let the casting pass over the bridge, the local authorities threaten proceedings for obstruction of the road. The deadlock has now existed for a month, and the subject is arousing much interest in the neighbourhood.

THE PATENT LAW.

A CORRESPONDENT of the *Times* writes:—Our English patent law differs from that of our commercial rivals in the careless liberality with which it treats foreigners. They obtain full protection in this country by complying with the most ordinary formalities; they occupy the time of our courts often to an inordinate extent, as in some recent cases; they can enforce

the extreme technical rights of a patentee, even to the grave prejudice of native industry and of the common weal; yet they are under no obligations to the State, nor do they make any return for the advantages they enjoy. The native inventor obtains the benefit of a limited monopoly on the ground that he is thereby encouraged to spend time, labour and money in developing industries which furnish employment, circulate capital, and aid this country to maintain and extend its foreign trade. The foreign inventor enjoys precisely the same benefits at the hands of the State, but is not bound to render any of these services in return. On the contrary, he is assisted and encouraged to employ labour in other countries, to circulate foreign capital and to promote the commercial advancement of our rivals in the markets of the world. He can and does make every ounce of his commodity abroad, dumps it upon our market and defends his monopoly against some native product, probably just as good, often upon the strength of a quibble which it takes a judge and an army of experts ten days to determine. This is probably supposed by some to be free trade. As a matter of fact it is diametrically opposed to free-trade principles. Free trade forbids all monopolies, limited or not, on the ground that they are *prima facie* opposed to the public interest. Only when this presumption can be rebutted by evidence that the public interest is better served by granting than by withholding a monopoly can the bestowal of protection be defended on public grounds. Now this country has no interest in protecting the inventions of foreigners. The foreign inventor will go on inventing upon the encouragement given to him by his own Government, and if he seeks protection at home he cannot avoid disclosing his process to the world. The interest of this country lies in following the free-trade presumption and refusing protection, because in that way it encourages the production by native labour and capital of what would otherwise have to be imported to the gain of the foreign monopolist. No State is bound to create a monopoly for the benefit of individuals, least of all for the benefit of persons who are not its own subjects, but rather their active competitors. Before they obtain protection they ought to show, much more clearly than the native inventor, in what way the State is to obtain advantages for itself and its own subjects.

Other countries are careful to insist upon this indispensable condition of protection. Admitting as they do that the civilised world has a collective interest in the encouragement of invention, they yet refuse utterly to contribute to that encouragement without remuneration. In France, for example, a patent is not

valid unless it is actually worked in the country within two years after it is granted. In other words, the patentee is allowed two years to show that he is going to give an equivalent by employing French capital and labour, and if he fails to do this his monopoly lapses. By the German law an inventor is bound within three years to put his invention to practical use within the realm, and to grant licenses on reasonable terms to other persons who may desire to work it. Failure to comply with these conditions makes the patent void. The law in both these countries is simple, reasonable and equitable. The State gives two or three years' protection upon credit. Thus the inventor has time to discover for himself and to show to others what the invention is worth in practice, and also to find out whether it is better to keep the working in his own hands or to license other parties. If it is not worth his while to do one thing or the other within the realm, then he is not allowed to flood the market with his commodities made abroad. There is no analogous provision in the English patent law except a clause dealing with compulsory licenses, which is a miracle of futility. It runs thus:—"If on the petition of any person interested it is proved to the Board of Trade that by reason of the default of a patentee to grant licenses on reasonable terms—(a) the patent is not being worked in the United Kingdom; or (b) the reasonable requirements of the public with respect to the invention cannot be supplied; or (c) any person is prevented from working or using to the best advantage an invention of which he is possessed—the Board may order the patentee to grant licenses on such terms as to the amount of royalties, security for payment, or otherwise as the Board, having regard to the nature of the invention and the circumstances of the case, may deem just, and any such order may be enforced by mandamus." Here, instead of the simple and automatically working provisions of the French and German law, we have the matter referred to the discretion of the Board of Trade, which can act only after an expensive inquiry in which the whole *onus probandi* is thrown upon the wrong shoulders. It is for the person who gets the monopoly to show cause why he should retain it, not for ordinary citizens to prove, first, that they have a *locus standi* which is not specifically conferred, and, second, that the patent is contrary to the public interest. It is not perhaps very wonderful that this remarkable clause has never been enforced. At present, however, there are several petitions before the Board of Trade invoking its power under the Act to compel certain foreign patentees to grant licenses to English manufacturers. As in some cases

very important and lucrative manufactures are in question, the action of the Department will be watched with much interest.

But what is the Board of Trade to do? This absurd clause has evidently been framed without a thought of the foreign patentee. It is directed exclusively against the British patentee who may refuse proper facilities to the British public. The Board of Trade, after inquiry, is to make an order, and such order may, if necessary, be enforced by mandamus. But what does the foreign manufacturer care for the mandamus of a British court? He is not within its jurisdiction, and it is more than doubtful whether any court could be found to make itself ridiculous by issuing an order which it has no power to enforce. There is no power to cancel the patent or to stop the importation of the commodity, although these are the only means at command of bringing the foreign patentee to terms. It would seem, therefore, that in order to secure for the State in this country the advantages insisted upon by other countries in return for conferring a valuable monopoly, it is necessary to make a change in the law. Instead of the ineffectual 22nd clause just quoted, there ought to be a provision something to this effect:—"If within three years of its issue, or, in the case of an existing patent, within eighteen months from the passing of this amendment, a patent is not worked within the realm to an extent adequate to meet the home demand, either by the patentee himself or by licensees, the patent shall become void." In this way all patentees, whether British or foreign, would be placed upon the same footing, and the remedy for existing evils would work automatically. Any patentee in advance of his age would retain protection, because there would be no public demand for him to neglect. The settlement of royalties would not be left to the judgment of the Board of Trade, but would be effected by agreement between the parties interested. Finally, the State would reap the advantages from foreign patents which it now derives only from English ones and which all our commercial rivals insist upon securing in return for protection.

ELECTRIC SUPPLY, LIVERPOOL.

A RESOLUTION of the Liverpool lighting committee on August 6, 1897, decided "that the city electrical engineer be instructed to report fully on the extensions of generating stations and plant that will be necessary to meet the demand for electrical energy in 1898." He has accordingly submitted a report which states that the equivalent number of 16 candle-power lamps

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

connected to the supply mains at various dates has been as follows:—July 1, 1894, 27,580; July 1, 1895, 33,732; July 1, 1896, 41,515; July 1, 1897, 57,336. In arriving at the above figures, each arc lamp is considered to be equal to nine incandescent lamps, and the electrical energy supplied for motors is expressed in the number of incandescent lamps that it would be capable of supplying. The increase in the number of lamps during the first year the supply has been in the hands of the Corporation has been nearly 16,000 lamps as against an increase of 8,000 lamps for the previous year. The equivalent number of lamps, for the supply of which applications have been received up to August 1, exceeds 63,000. Of this number about 7,500 lamps represent the supply of electrical energy to the Corporation for public buildings and street lighting. In addition to the demand for electrical energy for lighting, the favourable rates offered for power purposes are developing a demand for hoists and for motors for use in printing and other trades, and experience in other places indicates that a very material increase may be anticipated in this branch of the business.

In dealing with the extensions necessary to meet the demand for the coming year it is desirable to consider what the demands for electrical energy may ultimately amount to, so that any arrangements now adopted may form part of the larger undertaking that may be necessary to meet developments in the more distant future. The area of supply comprised in the Liverpool electric-lighting order of 1896 includes the whole of the extended city, a district about $7\frac{1}{2}$ miles long and 5 miles wide. It is not unreasonable to assume that this area may ultimately require the equivalent of 250,000 to 300,000 16 candle-power incandescent lamps, or, say, 25,000 horse-power for lighting and, say, 5,000 horse-power for motors and other purposes. In addition to this the tramways may ultimately require at least 10,000 horse-power. Although the plant required for lighting will always largely exceed that required for tramways, the advantages of a plan that provides for a supply of electrical energy for all purposes from the same stations are so obvious that the electrical engineer feels that the committee will desire to consider the subject in its broadest aspect and to invite the co-operation of the tramways committee, and he submits a complete scheme for their consideration. For this purpose he assumes that the power required at a not very distant period for the generation of electrical energy may be estimated as follows:—For lighting 25,000 horse-power, for motors 5,000 horse-power, for tramways 10,000 horse-power—total 40,000 horse-power.

The main points that require to be decided are:—The number, size and location of the generating stations, the system of generation and distribution, the type and size of plant to be adopted as the unit. When a generating station reaches a certain size, little if any economy in working can be attained by increasing its size. For example, two stations of 10,000 horse-power each can be worked with practically the same economy as one station of 20,000 horse-power, and by subdivision the risks of stoppage by fire, explosion and any other accident are minimised. Whatever system of distribution is adopted, a station is most advantageously situated when placed in the centre of the area to be supplied. In stations supplying energy for lighting only the average working hours at heavy load do not exceed two hours per day, and consequently the charges for interest and depreciation on the capital value of the plant form a much larger proportion of the cost of production than the coal bill. For this reason such stations should have plant of the simplest description and be located, as nearly as circumstances admit, in the centre of the area to be supplied. On the other hand, a station supplying energy for tramways will carry a large load throughout a working day of sixteen to eighteen hours, and in this case interest and depreciation are of less relative importance than the cost of fuel. Power stations therefore should be located so as to secure the cheaper delivery of fuel by railway or canal, and the additional cost of condensing plant may be wisely incurred.

It is often assumed that the cost of electrical energy depends mainly on the size of the generating station. This is not the case beyond a certain limit, but the main factor is the number of hours the plant can be run daily at a reasonably good load. The Paradise Street and Oldham Place stations are very favourably located for the supply of energy for lighting in the most important portion of the city, and when completed will be capable of supplying about 10,000 horse-power for this purpose, with due regard to economy of working.

Electrical energy can be generated and distributed either in the form of direct current or of alternating current, and either at high voltage or at low voltage, the latter not exceeding 500 volts. As regards the cost of production in the generating station, there is no difference between the two systems, except that the greater ease with which machinery can be worked in parallel on the direct current system somewhat lessens the cost of attendance. The alternating current is not suitable for directly supplying tramways or motors or for arc lamps or for charging accumulators, but has great advan-

tages when energy has to be distributed over very long distances at pressures of more than 3,000 volts. In every system of electrical distribution it is necessary to have a low pressure network of distributing mains to which the consumers' service lines are connected, and to convey the electrical energy from the generating station to this network by feeding mains. When a district is sparsely populated, or in cases where it is impracticable to find a suitable site for the station within the area of supply, the cost of low-pressure feeding mains may become commercially prohibitory, and it is then necessary to use a high-pressure system of distribution with transforming stations, in which the high-pressure current can be transformed into the lower pressure necessary for the distributing network. Any transformation of energy from one pressure to another entails a loss in the process and a certain amount of complication, and is consequently to be avoided as far as possible. For the work to be dealt with in Liverpool the alternating current system is for the most part unsuitable, and high-pressure and transforming apparatus unnecessary.

The pressure required for tramways is about 500 volts, and as the bulk of the Liverpool tramways are situated within a circle of only two miles radius, the direct supply of energy to them at the above pressure presents no difficulty. As regards lighting and motors, the supply is now given in all but the centre portion of the city at a pressure of 220 volts, and as the supply mains are arranged on the three-wire system, the pressure at the distributing points will ultimately be 440 volts.

The economical limit for distribution for lighting purposes at this pressure does not exceed two miles from the generating station, and, consequently, for some of the most distant portions of the area of supply the energy will have to be transmitted at higher pressure (say, 1,000 to 3,000 volts), and reduced at transforming stations to the pressure of supply. The areas to be dealt with in this exceptional manner will, however, be but a very small portion of the total area. Plant of similar design can be used both for lighting and for the tramways, which would reduce the amount of spare plant which would be required.

The electrical engineer submits for the consideration of the committee that the future demand for electrical energy should be provided for in the following way:—That sites should be secured, preferably at Pumpfields and Edgehill, for two generating stations, each with sufficient space to contain plant of 15,000 horse-power; that the stations should be designed for construction in sections as the demand for electrical energy

increases; that the system of generation and distribution should be direct current not exceeding 550 volts pressure, except for the outlying districts, and that the engines should be compound or triple expansion, with condensing apparatus, each capable of developing 1,000 horse-power at most economical load.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

17922A. John Shettle, for "Improvements in ruling or measuring devices."

19900. Emanuel Grinnall, for "'Simplex' window-sashes and casements."

19907. Stephen Charles Armstrong, for "Sash rattle preventer."

19962. Frank Garrett, for "An improved method of unlatching doors by the foot."

19971. Moses James Adams, for "Improvements in water-closets."

19972. Moses James Adams, for "Improvements in flushing valves."

20007. Adam McKee, for "Improvements in fittings for hose and like pipes."

20047. George Henry Rayner, for "Improvements in the construction of taps."

20073. Stephen Kempner, for "Improvements in lamp chimneys."

20111. Wray Cockroft, for "Improvements in door-locks or latches, and keys therefor."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{4}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITIONS OPEN.

BEXHILL-ON-SEA.—Designs invited for promenade pier and pavilion. Secretary, Bexhill Pier, Park and Land Company, Limited, 7 Sackville Road, Bexhill-on-Sea.

BLACKBURN.—The committee of the St. Mary's Catholic new infant school, &c., Dean Street, Blackburn, offer two prizes for the best plans for the school.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500l., 300l. and 200l. respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

COLNE.—Oct. 20.—Premiums of 50l. and 35l. for plans for technical schools, public library and public hall. Mr. T. H. Hartley, borough engineer, Colne.

DORKING.—Oct. 13.—Plans and estimates are invited for the erection of an infirmary. Mr. George Scales, clerk to the Guardians, High Street, Dorking.

LEEDS.—Oct. 8.—The Corporation offer premiums of 100l., 50l. and 25l. for the three best designs for a wholesale dead-meat market and abattoir. City engineer, Municipal Buildings, Leeds.

LICHFIELD.—Premiums of 10l. and 5l. offered for designs for nursing home and invalids' kitchen. Mr. R. R. Redmayne, 22 Dane Street, Lichfield.

LOWER BEBINGTON.—Oct. 1.—The Lower Bebington Urban District Council offer premiums of 50l., 35l. and 20l. for

the three best designs for a scheme of sewerage for that portion of their district now being drained into the Bromborough Pool. Mr. Thomas Sproat, 5 Castle Street, Liverpool.

LUDLOW.—Oct. 1.—The Corporation offer a premium of 20l. for the best and most economical scheme of electric lighting for the borough. Mr. John Herbert Williams, town clerk, Ludlow.

MERTHYR TYDFIL.—Sept. 30.—The School Board offer a prize of 10l. for the best plan of erecting a second floor to the infants' school. Mr. E. Stephens, School Board offices, Merthyr Tydfil.

MORECAMBE.—Oct. 1.—The Urban District Council offer a premium of 100l. for the best scheme of an improved and extended sewerage system. Mr. Jno. Bond, surveyor, Morecambe.

SKIPTON.—Sept. 30.—The Skipton and District Cottage Hospital committee offer premiums of 15l. and 5l. for the best designs for a cottage hospital, at a cost of 2,500l. Mr. W. H. Dawson, hon. sec., Skipton.

SOUTHEND-ON-SEA.—Nov. 20.—Plans invited for new church. Rev. E. E. Kimber, St. Albans, Avenue Terrace, Southend-on-Sea.

UXBRIDGE.—Oct. 30.—The Uxbridge Rural District Council invite plans for a scheme of sewerage and sewage disposal. Mr. Charles Woodbridge, 38 High Street, Uxbridge.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—For erection of cottages. Messrs. John Eaton, Sons & Cantrell, architects, Stamford Street, Ashton-under-Lyne.

BELFAST.—For erection of villa residence at Whitehead. Mr. Thomas Pentland, architect, 35 High Street, Belfast.

BELFAST.—Oct. 7.—For erection of a central police station and other works in Chichester Street and Town Hall Street. Sir Samuel Black, town clerk.

BETHNAL GREEN.—Oct. 5.—For construction of a hand-stand and other works upon sites on the Boundary Street area. Architect's Department, 17 Pall Mall East, S.W.

BIRMINGHAM.—Sept. 29.—For erection of epileptic accommodation at the workhouse infirmary. Mr. W. H. Ward, architect, Paradise Street, Birmingham.

BLAENAVON.—Oct. 9.—For erection of an additional classroom at the Garn Schools. Messrs. Lansdowne & Griggs, architects, Newport, Mon.

BOOTLE.—Sept. 30.—For building school. Messrs. Cox & Marmon, architects, 11 Dale Street, Liverpool.

BRADFORD.—Sept. 28.—For building seven houses and house and shop. Mr. Samuel Robinson, architect, 15 Cheapside, Bradford.

BRENTWOOD.—Oct. 2.—For erection of a boiler-house and extension of the clerk's offices at the asylum. The Medical Superintendent, Asylum, Brentwood.

BRIDLINGTON.—Sept. 28.—For erection of ten houses and premises, Fairfield Road, Hilderthorpe. Mr. J. Earnshaw, architect, Bridlington Quay.

BRIDLINGTON.—Sept. 30.—For alteration and repairs to Hardwick & Sons' shop and premises. Hardwick & Sons, Quay Road.

BURNLEY.—Sept. 29.—For erection of a memorial fountain, Queen's Park. Borough surveyor, Town Hall, Burnley.

CARDIFF.—Sept. 30.—For alterations and additions to the Barry Intermediate School. Mr. T. Mansel Franken, clerk, Glamorgan County Offices, Westgate Street, Cardiff.

CHADWELL HEATH.—Sept. 28.—For building foundations, lodges, &c., in connection with lunatic asylum. Mr. Lewis Angell, Town Hall, Stratford.

BERRY, CAMPBELL & CO.
WARMING & VENTILATING ENGINEERS,
62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure
Steam, expeditiously carried out on the most approved
principles. Special attention given to Private Residences.

ESTIMATES FREE.

CROYDON.—Oct. 4.—For internal repairs, cleaning, distempering, painting, &c., at infirmary, Mayday Road, Thornton Heath, and for certain repairs to and relaying portions of the tar paving at Workhouse, Queen's Road, Croydon. Mr. Harry List, clerk, Union Offices, Mayday Road, Thornton Heath.

DEVONSHIRE.—Oct. 6.—For taking down old and erecting new farmhouse and buildings at Lafter Hole, Princetown. Mr. Richard C. Merson, architect, Hollybank, Yelverton.

DORSET.—For erection of a footbridge in the parish of Moreton. Mr. W. W. Fookes, surveyor, Wareham.

DOUGLAS.—Oct. 2.—For constructing brick and stoneware pipe sewers. Messrs. Stevenson & Burstal, 38 Parliament Street, Westminster.

DURHAM.—Sept. 30.—For erection of a continuous brick kiln for a chimney 110 feet high. Mr. John Curry, manager, Chilton Moor, Fence Houses.

ENFIELD.—Oct. 13.—For erection of an isolation hospital on land adjoining the Northern Hospital, Winchmore Hill. Messrs. Young & Brown, 7 Southampton Street, Bloomsbury Square.

ERDINGTON.—Sept. 29.—For making roads. Mr. H. H. Humphries, Public Hall, Erdington, near Birmingham.

ESSEX.—Oct. 4.—For erection of a classroom to Highwood School, Writtle. Mr. A. P. Lindsell, clerk, Writtle.

FEATHERSTONE.—Sept. 28.—For erection of nineteen houses. Messrs. Garside & Keyworth, architects, Pontefract.

FORRES.—Sept. 27.—For additions to hydropathic establishment. Mr. John Forrest, architect, 129 High Street, Forres, N.B.

HALIFAX.—Sept. 29.—For building dwelling-house. Messrs. C. F. L. Horsfall & Son, architects, Lord Street Chambers, Halifax.

HALIFAX.—Oct. 4.—For erection of a drapery warehouse and offices in Rawson and Powell Streets. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

HALIFAX.—Sept. 29.—For erection of a dwelling-house on the Blackwood House Estate, Pellon. Messrs. Chas. F. L. Horsfall & Son, architects, Lord Street Chambers, Halifax.

HALIFAX.—Oct. 6.—For erection of a school to accommodate a mixed department in connection with the Triangle infant school. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HALTON.—For erection of four houses at Graveleythorpe. Mr. C. W. Lambert, 39 Whingate, Armley.

HARPENDEN.—Sept. 29.—For erection of police station. Mr. Urban A. Smith, county surveyor, 41 Parliament Street, S.W.

HAVERSTOCK HILL.—Oct. 13.—For erection of a gate porter's lodge at the North-Western Hospital. Messrs. Pennington & Son, architects, Hastings House, Norfolk Street, Strand, W.C.

HAWARDEN.—Oct. 2.—For erection of the county school. Messrs. Grayson & Ould, architects, 31 James Street, Liverpool.

HEMSWORTH.—Sept. 29.—For additions to the King's Head Hotel. Messrs. R. & W. Dixon, auctioneers, 5 Eastgate, Barnsley.

HILLSBOROUGH.—For erection of two houses. Mr. T. Peckett, 19 Wood Road, Hillsborough.

HOMERTON.—Sept. 29.—For building boundary walls and laying-out exercise-ground at the Hackney Union Infirmary. Mr. Frank R. Coles, clerk, Homerton, N.E.

HUDDERSFIELD.—Sept. 29.—For erection of offices and extensions to mill. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

IPSWICH.—Sept. 30.—For erection of business premises. Messrs. Eade & Johns, architects, Cornhill Chambers, Ipswich.

IRELAND.—Oct. 1.—For erection of a medical officer's residence and dispensary in the town of Arklow. Mr. B. Manning, clerk, Workhouse, Rathdrum.

IRELAND.—Oct. 2.—For alterations and additions to the Magheragall parish church. Mr. Blount, architect, Atlantic Buildings, Waring Street, Belfast.

IRELAND.—Oct. 9.—For building a chronic block and farm offices at the Mullingar District Lunatic Asylum. The Secretary, Board of Control, Custom House, Dublin.

IRELAND.—Oct. 4.—For erection of a stationmaster's office at the passenger station, Banbridge, and for alterations to the station; also construction and erection of platform roofs at Banbridge and at Clones, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

KEIGHLEY.—Sept. 27.—For erection of a fence wall at Marley. Mr. W. H. Hopkinson, borough engineer.

MCNEILL'S FELTS (Roofing, Inodorous, Sarking, Dry Hair, Damp Course, &c.) MCNEILL'S SLAG WOOL (Silicate Cotton), for Fireproofing and Soundproofing.

AS SUPPLIED TO H.M. GOVERNMENT, WAR OFFICE, ADMIRALTY.

Lists, Samples, and full Particulars free on application to—

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

A HANDBOOK to the "Workmen's Compensation Act, 1897," has been prepared by Mr. M. Roberts-Jones, and is published in a convenient form and at a low price at the offices of the *Western Mail*, Cardiff and London. The editor has had long acquaintance with the labour question, and has introduced as much information about the meaning of the sections as is likely to be required, until the judges have put the Act to the tests of the courts.

TRADE NOTES.

WE have been requested to announce that Messrs. Edward Humphries & Co., Limited, of Atlas Works, Pershore, have been awarded the gold medal for the exhibit of their improved oil engines at the International Agricultural Exhibition now being held at The Hague.

WAKEFIELD CATHEDRAL is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet tubes.

MR. P. ROLAND FULLER, of St. Ann's Road, South Tottenham, sends us his price-list and some specimens of work executed with his stencil plates. From the former we see that his charges are strictly moderate, while the quality of the work for sharpness and accuracy leaves nothing to desire. Mr. Fuller makes a specialty of his guinea builder's and decorator's assorted parcel, which includes a set each of 1 and 2-inch zinc stencil alphabets and figures, two stencil brushes, name in 2-inch zinc letters, a dozen specially prepared parchment stencils (assorted), and three zinc borders.

BUILDING AND BUILDERS.

THE foundation-stone of a new Primitive Methodist church at Dunstan-on-Tyne has been laid.

THE memorial-stone of the new halls in connection with the Cambuslang, N.B., parish church, has been laid. The new halls, which are well advanced, are being erected on the site of the old industrial school adjoining the church, and the estimated cost is 1,730*l*.

SANITARY CONGRESS, LEEDS, SEPTEMBER, 1897.

THE HIGHEST HONOUR. SILVER MEDAL AWARDED.

THE "FRYSTON"

SIMPLEX OR DUPLEX FIRE. SUCCESS IN COOKING GUARANTEED.

Made in all types, either Leamington, as shown, or Yorkshire type, with high and low oven, from 4 ft. 3 in. wide by 4 ft. 6 in. high, to almost any size, or of the Restaurant and Hotel class, with any number of ovens.

Also made in small sizes with one oven, and with either side or back boiler, from 3 ft. 6 in. upwards, with one oven and either back boiler and hot hearth with rings and plug, or side boiler.

BY FAR THE MOST EFFECTIVE KITCHENER IN THE MARKET.

PATENTEES AND MANUFACTURERS—

THE FERRYBRIDGE FOUNDRY COY.
FERRYBRIDGE, YORKS.

THE foundation-stone of the new Llangollen County School was laid on the 21st inst. The school is being erected in one of the loveliest spots in the valley, and is estimated to cost 4,790*l*.

IT is proposed to build at West Kirby a convalescent home of considerable magnitude. The plans of the building have been prepared, and have been for consideration before the Hoylake and West Kirby District Council. The council are desirous of assisting in the promotion of the undertaking as far as they can. West Kirby has been selected for the convalescent home on account of its excellent position and the salubrity of its climate. The proposed institution is to be in connection with the Hospital for Consumption, Mount Pleasant.

THE foundation-stone of a new Congregational church at Otley, to replace the one which has been in existence for upwards of sixty years, has been laid. The new building will contain sitting accommodation for 542 worshippers, but 700 may be comfortably accommodated when necessary. Contracts already accepted in connection with the building amount to 6,000*l*., but the cost of the church when completed will probably be 6,500*l*., exclusive of boundary walls.

ELECTRIC NOTES.

THE British Electric Traction Company, Limited, have removed to Donington House, Norfolk Street, Strand, W.C.

THE electricity department of the Bradford Town Council have had a total income of 8,726*l*., an increase of 1,789*l*. The total expenditure, including interest on loans, has been 7,061*l*., as against 5,929*l*. for 1896. The profit has been 1,665*l*., as against 1,007*l*. for 1896. The consumers number 591, as against 391, an increase of 33½ per cent. The total units of power supplied has been 443,288, as against 336,281, an increase of 31¼ per cent., whilst the total profits since the opening of the works in 1889 has been 13,833*l*.

A MEETING in connection with the electric-lighting committee of the Corporation was held on the 21st inst. in the Dublin Municipal Buildings, to consider the state of the existing electric light supply. Recently it appears the cables conveying the current had become somewhat worn, and the meeting was summoned to consider the advisability of raising a sum of about 20,000*l*. for the improvement of the cables. It was resolved to recommend a scheme for adoption by the

committee at a future meeting, and it is stated that the feeling of the meeting appeared to be in favour of obtaining a loan of 100,000*l*., and the construction of a new power station at the Pigeon House Fort; and that meanwhile it is intended to obtain estimates for the relaying of the present system with improved cables.

THE electric current, which can be harnessed to supply most of the wants of man, has now been employed for the extinction of fire by a valuable and ingenious arrangement worked out by Messrs. Merryweather, the well-known water and electrical engineers, at Lord Rothschild's house in Piccadilly. The mansion is lighted by electricity, and a patented form of pump, driven by an electric motor, is placed in the basement, and in the event of a fire this machine may be immediately started and water forced through hose at a great pressure to attack an outbreak in any part of the house, or on the roof. The arrangement commends itself for many of our theatres, in which the water company's pressure in the flies and on the roof is utterly inadequate for dealing successfully with an outbreak of fire. We understand a similar arrangement is fitted in Mr. Harry McCalmont's house at Newmarket, and in Lord Salisbury's house at Hatfield.

VARIETIES.

IT has been decided to restore the picturesque old church of Mundesley, on the Norfolk coast.

IT is proposed to construct a new dock at Avonmouth by the Bristol City Council at a cost of 1,500,000*l*.

THE Birmingham new meat market is to be ready for formal opening on the 27th proximo.

THE members of the Architectural Association will pay a visit to the Grove Hospital of the Metropolitan Asylums Board to-morrow, 25th inst.

DRY-ROT has broken out in the ladies'-room of the new infant department at Low Blantyre School, the cause being said to be due to damp and imperfect ventilation.

A WORKMAN named Thomas McCormick, engaged on the extension works at Ramsey Pier, was struck by the handle of a crane and sustained serious injuries to the head and both arms.

A GREAT fire occurred in the bazaar of Cabul on the 6th and 7th inst., when 150 shops were burned out and four persons were burned to death.

THE North-Eastern Railway Company are said to have opened negotiations with a view to the purchase of Earle's ship-building yard at Hull for the purpose of constructing a new deep-water dock.

THE new font, pulpit and bells which have been added to the church of St. Paul's, and which Sir Charles Seely had built for the new parish of Daybrook, have been dedicated by the Bishop of Derby.

AN agreement has been concluded between the Great Western Railway, the London County Council and the Paddington Vestry as to the arrangements for reconstructing and widening, at a cost of 17,000*l.*, the railway bridge and the approaches at Westbourne Park. The thoroughfare is to be 50 feet wide between the pavements.

A DISASTROUS fire occurred on Southport Pier on the 18th inst., and caused damage to the extent of about 5,000*l.* The fire broke out about three o'clock in the morning in the pavilion, and the flames quickly spread to the adjoining refreshment bars. The roof of the pavilion soon fell in, and the walls were burned through. A considerable length of the decking of the pier itself also succumbed to the flames.

THE Dukinfield new town hall committee have decided to invite competitive designs and offer a considerable sum in prizes for the best designs. The cost of the new building is to be 7,000*l.* or 8,000*l.* It is to be erected on the market ground in the centre of the town, with a frontage to the principal thoroughfare. This scheme, in conjunction with the new recreation ground recently determined upon, represents the town's commemoration of the record reign.

THE remains of Mr. Thomas Gough, architect and surveyor, Knighton, were interred at Knighton on the 13th inst. The deceased gentleman, whose death took place on the previous Thursday, was fifty-nine years of age, and had held the appointment of surveyor to the Knighton Highway Board, which was superseded by the Knighton Rural Council under the Local Government Act of 1894, for nearly twenty-five years. He carried on an extensive business also as an architect.

THE famous Wesley Chapel in Church Street, Spitalfields, one of the largest and oldest places belonging to the Methodist body in London, has been sold for conversion to the uses of a

synagogue. Less than twenty years ago the most famous preachers of Methodism drew crowded congregations there, and Wesley preached often in the early days. Only a few months ago Artillery Lane Chapel was turned into a synagogue, and an effort is being made to secure another large chapel in Whitechapel.

THE Treasury Commissioners have issued a circular to School Boards giving notice that the rates of interest chargeable on public loans under the Public Works Loans Acts will hereafter be, for loans repayable in not exceeding thirty years, 2½ per cent. per annum; not exceeding forty years, 3 per cent. per annum; and not exceeding fifty years, 3¼ per cent. per annum. Two-and-three-quarters per cent. is the lowest rate of interest allowed by the Act.

AN interesting discovery of skeletons has been made just outside the city in the course of excavations made for laying drainage pipes. Some of the skeletons, which are supposed to date back to the time of the Romans, were perfect, but collapsed upon attempt being made to remove them. Others, however, were dug out in a fairly perfect condition and have been removed. There are skeletons of horses, and the site on which they were found was probably at one time the scene of a pitched battle and may possibly be an old burying ground.

IT is proposed to construct a lock on the Thames below Putney Bridge at a cost of 250,000*l.* Mr. E. Pritchard, C.E., who has been commissioned by the combined committee representing the districts of Hammersmith, Fulham, Chiswick, Brentford and Isleworth on the Middlesex side of the river, and of Putney, Barnes and Mortlake on the Surrey side, to report on the best position for such a lock, is of opinion that the proposed sluices should be situated at a point of the river on the Middlesex shore from the Broomhouse, Dock Lane, to land directly opposite on the Wandsworth side. It is estimated that the work would take four years to complete.

IN the course of the excavations which are being carried out at Furness Abbey a bulla, or leaden seal, has been discovered, which dates from the thirteenth century. The seal has been attached to one of the five bulls sent to this Cistercian establishment in the time of Pope Innocent IV. and whilst William de Middleton was abbot of Furness. The first of these bulls dealt with the cultivation of vines and the fisheries of Lancastria. The bulla, which was found at the south-western corner of the ruins, is about the size of a crown piece, but rather thicker and

almost round. It is in excellent preservation. One side bears representations of the heads of St. Paul and St. Peter, with a crozier down the centre, and over the heads the letters "SPA.SPE." On the reverse side is the inscription, "Inno-centivs PP.: III."

THE South Hackney Synagogue, in Devonshire Road, Mare Street, Hackney, was opened on the 18th inst. by the Hon. Walter Rothschild. The buildings, which are situated nearly two miles away from any other Jewish synagogue, and have cost 8,000*l.*, are from the designs of Mr. Delissa Joseph, and are similar in structure to the Hampstead and Hammersmith Synagogues, which were designed by the same architect, the almehmar, or reading-desk, being placed immediately in front of the Ark, and not in the centre of the building, as was formerly the general custom. The curtain of the Ark is placed inside and not outside, while the background of the building is of a pure white.

THE Clubbiedean Reservoir in the Pentland Hills is at present empty. It is in the hands of Messrs. Young, contractors, undergoing repairs. There has been a leak through the embankment for several years, and though not of an alarming nature it was recently decided to find out the cause of it and make the embankment watertight before the good weather ended. In digging down where the water appeared at the tail of the embankment it was found that the ground was of a very loose, rocky nature, with numerous fissures in the rock, and it was through these cracks that the water was making its way below the puddle wall. What will now be done will be to cut deeper than the old foundation of the puddle trench, and fill up the fissures with concrete and clay—a good supply of the latter material being found near the reservoir.

THE Smethwick District Council have decided to establish refuse-destructor works at once, and a committee, consisting of members of the Council, has been appointed to visit various towns where destructors are in operation. Negotiations have also taken place for the acquisition of a suitable site for the works. These negotiations have been completed by the purchase of the Crown Forge estate, situated in Rolfe Street, Smethwick, which was formerly carried on by Messrs. Wickham. The price paid for the estate was 4,000*l.*, payment of the money to be made by instalments spread over a period of twenty years, at an interest to be charged at the rate of 2½ per cent. On the site of the proposed works there is a tall

stack which will be utilised, and there is also an extensive canal frontage. Steps are to be taken at once to provide the necessary works. The cost of the scheme is estimated at several thousands of pounds, but it is anticipated that it will in the end prove a great saving to the ratepayers.

THE Stafford sewage works, which have been established in the town at a cost of about 52,000*l.*, were formally opened on Wednesday. The mayor (Mr. F. Greatrex), members of the Council and invited guests, met at the Borough Hall, where they marched in procession to the sanitary dépôt. There a silver key was presented by Mr. Blackshaw, the borough engineer, to Alderman C. H. Wright, the chairman of the sewerage committee. With a duplicate key Mr. Wright opened the door of the engine-room, and, the company having entered, he delivered a short address, giving the history of the works. At the close he presented keys to the Mayor and Mr. W. G. Bagnall, formerly chairman of the sewerage committee. The Mayor opened the valve on the pumping main, and one of the engines was started by Mr. Bagnall, after which the Mayor declared the works open. The sanitary dépôt was inspected by the company, attention being devoted to the new refuse destructor. The company afterwards proceeded to the outfall works on the Lammascote Farm, and an explanation of the process of filtration was given by Mr. C. H. Wright.

THE Countess of Derby opened on the 16th inst. the new Victoria Jubilee Technical School at Preston, which has been erected as a permanent memorial of her Majesty's Jubilee. The school has been erected at a cost of 15,000*l.*, and stands on a site given by the Corporation, containing some 5,800 square yards and situate in Corporation Street. The foundation-stone of the new school was laid on July 6, 1895, by Mr. W. Ascroft, president of the Harris Institute. The building, which presents a noble and imposing appearance, is Gothic in style, consists of three storeys, and has a frontage of 150 feet to Corporation Street. It is constructed of Accrington red brick, with rich ornamental stone dressings. On the sub-floor are located various classrooms, including a splendid weaving school, 84 feet by 64 feet, and a spinning school 64 feet by 40 feet. All the woodwork is finished with beautifully grained pitch pine. The rooms are all 15 feet high, and are exceedingly well lighted. At the top of the grand staircase is the lecture theatre measuring 50 feet by 40 feet, and surrounded by a spacious gallery. The school is fitted throughout with electric light and hot-water heating apparatus.

THE NEW NORTH BRIDGE, EDINBURGH.

THE new North Bridge, which was formally opened on the 15th inst., replaces, says the *Scotsman*, the old North Bridge which, begun in 1763, was opened in 1772, having taken nine years to build. Under the present contract the old bridge has been renewed and the new bridge erected in about two and a half years. The contract for the new bridge was signed on March 11, 1895, by Sir William Arrol and on March 19 by the Town Council, and it was stipulated that the work should be completed by May 1, 1897. The contractors got possession of the bridge on April 12, 1895; and after that there were points to be adjusted connected with the carrying of the southern abutments further south than was originally intended, in order to improve the gradients, so that on a work of this magnitude the few months additional required for its completion cannot be regarded as excessive. Messrs. Beattie, Fountainbridge, were sub-contractors for the important masonry contract; and to harmonious working between the parties is due the successful carrying out of the undertaking within so short a period. The work was one of no ordinary kind, and it was not wholly free from danger, due to the fact that the old bridge had to be taken down and the new bridge built without interfering with the railway traffic being carried on underneath, or the tramway and other street traffic above. Scaffolding of a peculiar construction had to be employed, and methods of working more or less of a novelty had to be introduced as the work went on; but all has now happily ended in the most successful manner. As an example of smart workmanship, it may be recalled that the first half of the new bridge, having been completed, was opened about October 12, 1896, and that the remaining half of the old bridge was taken down and the last half of the new bridge built between that time and this—a period of eleven months. It is only a pity that the graceful arches of the bridge will be somewhat hidden by the roofs of the station sheds. Possibly the best view of the structure will always be secured from Jeffrey Street. But in any case it will be an immense improvement overhead to the street traffic, while underneath the railway company will get, in greatly enhanced facilities for the carrying on of their traffic, the full value of their contribution towards the cost of the bridge. The new bridge is built under an Act of Parliament obtained in 1894, which also authorised the widening of North Bridge Street—an improvement now also in progress. Constructed of iron

girders resting on stone piers and abutments, the new bridge consists of three spans of 175 feet each. The width between the parapets of the new bridge is 75 feet, as compared with 54 feet of the old bridge as altered more than twenty years ago. Each span is formed of six steel arched ribs, each 175 feet from pier to pier, with a 20 feet rise at the centre of the arch. They are set into the masonry of the abutments in cast-iron "springers," each weighing 12 tons. The holding-down bolts are 3 inches in diameter. Each rib or "boom" is 4 feet in depth by 1 foot 9 inches in breadth, and it weighs about 40 tons. They were built at the Glasgow works of Sir William Arrol (Limited), were milled to suit the radius and were delivered in 9 ton "lifts" or segments. On the top of these "booms" are fixed vertical posts which carry longitudinal girders, and on these again are fixed cross girders which carry the brick arching forming the roadway. The whole is braced diagonally and horizontally by lattice girders, &c. In the bridge there is about 2,000 tons of chilled steel and about 500 tons of cast-iron work, which is chiefly of an ornamental nature. The spandrels of the great spans, for example, are filled in with an arcading graduated in height, surmounted by a frieze broken up by carved corbels, and carrying a pretty moulded festoon of flowers and fruit. At each end of the large spans is an expansion joint, which has a play of an inch and a half so as to make due allowance for expansion and contraction caused by the summer and winter temperature.

In taking down the old bridge nothing of great interest was found. The only curious objects embedded in the masonry were an old pewter jug, now in the Antiquarian Museum, and several old moulded headstones and carved stones, as if from an ancient church. Search was made for the foundation-stone which was laid on October 21, 1763, by Lord Provost Drummond and the "Merrie Masons" of his day, but it was not discovered, and in all likelihood now never will be. The abutments at the south and north ends of the bridge rest on solid rock. The two large piers are built on concrete foundations, laid, the south pier 40 feet below the rail level and the north pier 35 feet below ground. Each of these piers is 100 feet long, measuring from east to west, and 22 feet in thickness. They are "hearted" with brick laid on cement, and faced with grey sandstone ashlar. In the construction of the bridge there has been used by the Messrs. Beattie 100,000 cubic feet of ashlar, equal to 8,333 tons; nearly 3,000,000 bricks, and 10,000 cubic yards, or about 800 tons, of concrete. In addition to this there was half a million

of blue bricks required for the arching already alluded to which carries the roadway. From the spring of the arches the piers are carried up above the iron parapet of the bridge with ornamental panelled and moulded faces, and below the top moulding is a carved ornament. The flat tops of the piers would form suitable pedestals for groups of statuary, but unless these are presented the city fathers, with all their heavy responsibilities, are not likely to go in for them at present. In regard to the roadway it may be explained that on the top of the arched brick asphalt has been spread, and on that are placed the granite blocks of the roadway. The cable rails have, of course, been laid, and on each side of the roadway of the bridge a subway for pipes has been constructed, about 12 feet by 2 feet in depth, with manhole entrances at each pier. The engineers of the bridge were Messrs. Cunningham, Blyth & Westland, C.E., Edinburgh; the city superintendent, Mr. Robert Morham, designed the elevations; the contractors were Sir William Arrol & Co., Limited, Glasgow, with Messrs. William Beattie & Sons, Edinburgh, sub-contractors for the masonwork. The cost is 90,000*l.*, of which the North British Railway Company contribute 30,000*l.*

ST. JOHN'S CHURCH, WORKINGTON.

THREE schemes are proposed by the restoration committee for the restoration of St. John's Church, Workington. The most important alterations are those which provide for the erection of a chancel extending into the church about 30 feet; to remove the choir into seats provided in the chancel; to rebuild and enlarge the organ in its present condition; to effect a connection between organist and choir by electricity; to reseal the ground floor; to put in a new heating apparatus and to adopt a proper system of ventilation. The cost of these alterations is estimated at 3,300*l.*; while to carry a frieze all round the church inside, supported by pilasters at each side of the windows, and to panel the ceiling and to erect a reredos, would cost 2,000*l.*; and to erect new galleries, alter the gallery stairs and to make minor structural alterations, would cost 1,800*l.* It is feared that the full effect of the proposed restoration would not be realised unless it is carried out in its entirety, but if sufficient funds are not forthcoming for the purpose it is recommended that the first part only of the scheme shall be undertaken.

THE MERCHANDISE MARKS ACT.

THE report from the select committee on Merchandise Marks, together with the proceedings of the committee and minutes of evidence has been published as a Blue-book. The committee commence their report by a reference to the untimely death of Mr. Mundella, who was specially qualified to express an opinion as to the working of the Act. The committee premise their general report by remarking that they "are satisfied that the operation of the Merchandise Marks Act of 1887 has been on the whole beneficial." There is, the committee add, abundant evidence that the Act has to a great extent stopped the fraudulent practices against which it was directed, while the effect of those portions of the Act referring to the imitation of proprietary trade marks and false trade descriptions has been especially beneficial. The establishment and observance of higher standards of honesty has tended to inspire confidence in the accuracy of the marks placed on British goods, and to enlarge to that extent and give stability to the trade of British merchants and manufacturers. Notwithstanding, therefore, that the competition of improperly marked foreign goods is still in some cases injurious, and that merchandise marks legislation has made little progress outside the United Kingdom, India and the British Colonies, the balance of the evidence is in favour of retaining the greater portion of the Act. The committee consider that the Act is now so well understood both at home and abroad that they would strongly deprecate any change in its chief provisions relating to the importation of goods for use in the United Kingdom. As to the complaint received from the transit trade, who allege hindrance through the opening of packages, the committee are of opinion that this particular trade has not kept pace with the expansion of the export trade of this country, and they think it would be misleading to attribute the result complained of to the operation of the Act, especially when the committee have evidence of the increase of bounties and subsidies granted by foreign governments to their national lines of shipping, expressly designed to foster foreign trade in national bottoms, and officially declared to have done so. Moreover, the report points out some foreign State railways have adopted a system of reduced fares to seaports which are prejudicial to British interests. The evidence on the point of the decline of the transit trade is, therefore, not conclusive, although the Board of Customs and other witnesses believe that the examination of goods in transit operates in that direction. The committee are

of opinion that this examination is ineffectual to prevent the fraudulent use of British trade marks on goods passing from foreign ports to other countries or British colonies, and on consideration of the whole case the committee recommend that goods in transit be exempted from the operation of the Act. The committee believe that the orders of 1896 as to the detention of goods which bore marks raising a direct claim to British origin had given great relief, but the committee are of opinion that it is unnecessary and uncalled for by the Act to detain goods, and insist upon a qualification because they are marked with English words of description, unless such words are calculated to deceive the purchaser in regard to the country of origin. Moreover, they think that the Customs should move in the direction of requiring the excision of offending marks rather than in that of requiring a qualifying mark, which has been proved to the satisfaction of the committee to be in many cases a gratuitous and altogether unnecessary and undesirable advertisement of our foreign competitors. Unless therefore the Customs relax their regulations as the committee suggest should be done forthwith, they recommend that a provision to the foregoing effect shall be placed in any Bill introduced to amend the Act of 1887. As to the marking of imported goods, the committee think that it should not be unlawful for traders to stamp goods with their own names and business addresses, provided that some such words as "sold by" be added.

SANITARY INSTITUTE HEALTH EXHIBITION.

The Ferrybridge Foundry Company.

THIS firm exhibit the "Fryston" kitchener, which created a great amount of interest, and was the object of much attention, both to the members of the Sanitary Institute and visitors. The principle of the "Fryston" kitchener is novel and the construction scientific. The "Fryston" Duplex are made on the open and close fire principle, but differ from all other kitcheners in having two fires in one fire-basket, the upper fire being lighted upon an adjustable grate near to and level with the upper part of the ovens and under side of the hot plate, the lower fire being placed almost on a level with the bottom of the ovens, leaving an air space between the two fires through which air is supplied to both—upwards to the upper fire, and downwards to the lower fire. This air, being sandwiched between the two fires, is thoroughly heated before coming in contact with either of them, hence producing great heat. The great advantage of this plan is that all the heat is supplied to the ovens and hot plate through horizontal and ascending flues, without any descending flue whatever, insuring a still fire without any "roaring," thus effecting a considerable

saving in fuel. Each fire has its own damper, so that more top heat for ovens and hot plate is secured by drawing out the upper fire damper further than the lower, and *vice versa*. The kitchener is filled throughout with self-contained flues, which simplifies the fixing. During the exhibition we had many opportunities of observing the results obtained, and found during a period of nine hours the temperature of the ovens registered (with only a variation of two or three degrees) 450 deg. The amount of fuel consumed during this period was extremely small, as was also the quantity of ash resulting, while the quantity of smoke escaping from the chimney was practically nil. The flues will thus require only very occasional clearing out.

After a series of severe tests the judges gave this kitchener the highest award—a silver medal.

The "Fryston" is also made with a lifting or rising or falling fire, which has advantages over any of this class we have seen. The fuel, by a special arrangement in the section of the rising and falling grate, is always kept exactly central to the flues that it has to supply with heat instead of falling forward to

the bars of the grate when down and backward to the face of the pressure boiler when raised. The bars are designed to prevent the rising or falling grate slipping from its position when any extra weight is added, such as a kettle of water, saucepan, &c., and indeed it is quite impossible for this to happen. This stove was awarded the bronze medal of the Society.

The Ferrybridge Foundry Company, whose address is Ferrybridge, Yorkshire, received the only medals awarded at the exhibition.

The Leeds Art Pottery and Tile Company.

We are particularly struck with the exhibit of the Leeds Art Pottery and Tile Company, of Hunslet, Leeds. They show a large selection of dados in faience, which for finish and harmony of colour are unsurpassed by anything we have seen. It is evident this firm make the arrangement of colours their special study, and in this they have been most successful. A new departure is a panel treatment of dull or egg-shell glazed embossed tiles, in a cream tint with glazed grey-blue moulding. The ornament under the dull glaze has lost none of its sharpness, and the effect of the combination is very good. The Leeds Art Pottery and Tile Company are also showing a sample tile dado, fixed at the new General Hospital, Birmingham, and a number of special tiles used for this job. To judge from the great number of various shapes, especially of the many internal and external rounded angles made to the architect's design and instructions, one can form some idea of the magnitude and importance of this work. We purpose giving an illustration of one of the Tower staircase lobbies in one of our early issues. This firm was awarded the Sanitary Institute's medal for the excellence of their work.

Pendleton's Sanitary Engineering Company.

This firm are exhibiting Dr. Quine's patent sanitary dustbin, of which they are the proprietors, and to show its proper working and fixing they have built in brick the backyard walls. It is constructed of steel plate galvanised, and is hung on pivots in the frame of an opening in the wall of a backyard. It holds over 4 cubic feet—sufficient for one or two weeks' refuse. We illustrate views of inside the yard and outside. The dustbin is fitted with a dead-weight lock, without any spring, and is self-locking.

The advantages of this system are many: The scavenger no longer requires access to the premises. He is supplied with

a key that fits every dustbin, and, after unlocking it, the bin is tilted forward and the whole of the contents is discharged into a light box on a trolley, which is wheeled from house to house until filled and then easily emptied into the cart. The bin is then lifted into position, and is at once self-locked.

If necessary, the scavenger can throw disinfectant into it before locking up, ensuring absence of decomposition and the attendant ills.

Where the walls abut on the road a wooden door is provided which, when closed, hides the dustbin from sight. Owing to the simplicity of its construction, the wear and tear is reduced to a minimum, and it cannot get out of order. It takes up no yard room, as it projects only a few inches from the wall.

Their claim that it marks a revolution in backyard sanitation seems justified. It has already been adopted by the Manchester Corporation among others, and is giving every satisfaction. The address of the company, who were awarded the bronze medal of the Society, is 1 Leaf Square, Pendleton, Manchester.

Messrs. W. Summerscales.

Messrs. W. Summerscales, of Phoenix Foundries, Keighley, are well represented by their washing machines and laundry appliances, conspicuous among which is the patent "Triumph" washing machine, which is made in three sizes and consists of two heavy cast-iron ends, having their centres truly bored. The ends are stayed apart to the required distance by strong stays, with turned and faced collared ends abutting on to machined facings on the end castings, thus securing correct, mechanical and permanent adjustment entirely independent of the body of the machine, which, being an unknown quantity owing to expansion and contraction, gives much trouble in other makers' machines. The revolving drum is constructed of two strong cast-iron discs, lined with brass, and staved apart with turned and collared stays, the body being formed of pitch-pine, perforated, the hinges and fastenings of strong cast brass. This drum is fitted with patent automatic reversing

motion and locking gear, the former causing the machine to change its direction of rotation every few revolutions, thereby preventing the twisting and roping of the linen so disastrous in other machines, the latter locking the starting gear when standing, and at once removing what has always been a source of danger to the attendants of washing machines, viz. the possibility of the machine starting during the operation of loading or unloading. The gearing is carried by a strong box section bracket, which, together with the seatings on the end, is machine-faced and strongly bolted. This machine is fitted with steam inlet valve, hot and cold water supply cocks, gauge glass for registering height of water, and emptying cock of large dimensions; is self-contained and requires no special foundation; is easily fixed and set to work, and readily operated by unskilled labour.

Messrs. Garner & Co.

At stand No. 16 Messrs. Garner & Co., Lightwoods Road, Smethwick, show Webb's patent reversible window sashes, in which a new departure has been made, as the sashes are pivoted and placed in the frame one immediately over the other in a direct line and not as with other windows one behind the other. This arrangement brings the insides of the stiles of both sashes flush with themselves and with the frame, which enables the employment of hinged and locking flies at the sides of frame by which the sashes can be made perfectly firm, draught, dust and burglar proof. The sashes being loosely hung can be easily taken out of frame for the removal of furniture, &c., while by the use of special friction pivots or locking bolts, each sash can be regulated and securely fastened at any required angle for air inlet or for cleaning, glazing or painting inside room. A special locking arrangement is provided for asylums, infirmaries, &c. Ordinary window sashes can be altered to this system at a moderate cost.

Mr. Richard Mason.

Mr. Richard Mason, of Hemsworth, Yorks, also shows a reversible window, some of the advantages claimed for which

are simplicity of design, arrangement and operation, full weight, always bearing direct on the pivots and cases, and never dependent on the screws; ventilation on the most approved principle; in every case the air is directed upward, the full width of the window, thus driving vitiated air out of room; window can be opened for ventilation day or night, and the sashes be held secure; safety in cleaning, as the outside of the sashes can be turned into the room, thus all danger avoided; the price is such that they are being used in all classes of work, from the cottage to the mansion.

A New Scavenging Broom.

A new and very effective form of scavenger's bass broom is now being manufactured by the New Patent Broom Company, of Paragon Works, Stoke Newington, N., and we have pleasure in commending it to the notice of surveyors, contractors and others. The new broom, which possesses greater cleansing power, is quite unique in the manner of its construction, the stock or head being made up of a series of grooved slips of beechwood, instead of the usual solid block with holes for the reception of the bass. In the ordinary pattern, as is well known, much trouble is caused by tufts or knots of material falling out, especially in the summer-time, and so spoiling the broom; in the "Paragon" this is practically impossible, as the material is held so very solidly in the stock. The bass for each groove having been accurately weighed and pitched and laid in position, the whole series of slips are forced firmly together by means of powerful machinery, and a number of strong rivets driven right through the sides of the stock whilst still under pressure. The finished article convincingly illustrates the old

axiom about unity and strength. We are not surprised to learn that the new broom is finding favour wherever introduced. It is already used in many large provincial towns for street cleaning purposes, and has been found to clean quicker and better, to wear longer and more evenly, than the ordinary pattern, for each fibre, being closely pressed to the other one, there is on the whole length of the broom a solid row of bass, making it impossible for dirt and water to escape, as through the open spaces between the bundles of the old style. Therefore less exertion is necessary to clean a certain area with the Paragon broom than with an ordinary one, whereby the bass of the broom lasts longer. The conditions of manufacture preclude the production of any other than a flat back stock, but the shape of a broom is a very small matter as compared with its practical utility, and the æsthetic street-sweeper will learn to value a flat-back if it sweeps up the mud with one drive instead of two. The "Paragon" is made in three qualities and the usual sizes up to 18 inches, and we have no doubt the manufacturers will be pleased to furnish samples and further particulars that may be required.

Messrs. Adams & Co., engineers and sanitary specialists, Leeds, write to us to point out the fact that neither their sanitary work nor their patent sewage lift were submitted to the judges for competition. They departed from their custom on this occasion and exhibited their specialties, but they feel that the best and highest award is the good opinion of those who have the appliances in actual use.

NEW CATALOGUE.

Messrs. HARTLEY & SUGDEN, LIMITED, Atlas Boiler Works, Halifax, who have received 45 awards during the past 25 years, including the Gold Medal given at the Birmingham Horticultural Show after actual working test on 1,000 feet of 4-inch pipe with which they were in competition with twelve other makers, are sending out their new supplementary catalogue of boilers, the various kinds of which are illustrated by means of clear well-cut blocks. The prices, dimensions, heating powers and all other necessary information are explicitly given. We would specially draw attention to their new patent independent "Eiffel" boiler, which is a powerful and economical boiler, and has proved most satisfactory in work; the larger sizes are made with bent tubes welded into the fire-box, which add valuable heating surface and give rapid circulation of the water; and their "Lion" hot-water independent base-burning boiler, arranged with shallow fire-box of good diameter. The tubes are placed so as to give the best results from the fuel used. The list price of the "Lion" varies from 31*l.* to 93*l.*

PALACE THEATRE.

THIS beautiful theatre having, under the energetic and judicious régime of that *doyen* of managers Mr. Charles Morton, emerged from the gloom of oblivion and neglect into the full midsummer radiance of the sunshine of popularity, now shows a bill which caters for every taste, and satisfies the most fastidious. The programme contains no less than seventeen "turns," all of which are, of their kind, alike excellent. The *pièce de résistance* is undoubtedly the American biograph, which is quite the best series of moving photographs yet seen in London, and alone would well repay a tedious journey. The different pictures, most of which are new, are so clear and steady that it is difficult to imagine that any further improvement can be introduced, while the figures are life-size and the portraits admirable. Among the artistes who contribute to the making of an admirable evening's entertainment Will Crackles continues to cause amusement by his impersonation of a burglar whose strenuous and somewhat noisy efforts to force a safe supposed to contain untold gold are interrupted by the entrance of a housemaid who opens the safe by a mere touch and fills a scuttle from the coals which are its sole contents. This is not perhaps very high art, but it serves to amuse. J. Radcliffe (flautist) plays a fine instrument with great brilliancy and refinement, and Mlle. Deyo delights everyone with her charming appearance and graceful dancing. The dexterity and whimsicality displayed by Mr. W. E. Ritchie (tramp bicyclist) elicits unstinted laughter and approval. Other excellent items are supplied by Edith Yorke, Will Hebden, Mary Gray, Lily Morris, the De Forrests, Wilson and Waring and others, and last, but by no means least, the excellent orchestra under the able conductorship of Mr. Alfred Plumptre, besides affording the necessary valuable assistance to the artistes, plays a selection of *morceaux* in a manner which disarms criticism. Mr. Morton, not satisfied with a crowded house every evening, has again started his season of Saturday *matinées* for the winter, and there is no doubt that they will "catch on" as heretofore.

SEPARATION OF BUILDINGS.

UNDER section 74 (2) of the London Building Act it is necessary that in every building exceeding 10 squares in area used in part for purposes of trade or manufacture and in part as a dwelling-house, the part used for the purposes of trade or manufacture shall be separated from the part used as a dwell-

ing-house by walls and floors constructed of fire-resisting materials, and all passages, staircases and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials. On the 16th inst. Messrs. Simpson & Cove, builders, were summoned by Mr. A. Payne, district surveyor, for non-compliance with the conditions required by the section. Defendants had made alterations and additions to a public-house, Devon Arms, 38 Morning Lane, Hackney, exceeding 10 squares in area, and had formed an approach from the back leading to the bar and the staircase for the use of the dwelling-house without fitting the opening between the said approach and the bar with fire-resisting doors. The defendant replied that he was carrying out the instructions of the architect, who said the doors were not necessary. The defendant was fined 10s. and 12s. costs, with an intimation that he would be liable to a further penalty if the doors were not placed there.

This agrees with recent decisions on the point.

LANDLORDS AND SANITARY INSPECTORS.

IN the City of London Court, on the 16th inst., before Mr. Commissioner Kerr, a case of some importance was disposed of. Mr. Robert E. Clarke, builder, Finsbury Pavement, E.C., sought to recover the sum of 10l. 2s. against the defendant, Mr. Frederick London, of Edmund Street, Birmingham, for work done at 85 Finsbury Pavement, of which the defendant was the landlord. Mr. Harry Dade, for the plaintiff, explained that the defendant's London property was managed by Tillett and Yeoman, a firm of estate agents. The house in question had been empty, and they succeeded in letting it. The tenant wanted certain repairs done which the plaintiff estimated would cost 85l. The order was given him; and, indeed, the 85l. had been paid by the defendant as the landlord. But while the work was in progress the City of London sanitary inspector visited the house. That official ordered the plaintiff to do extra work for which he now asked the defendant to pay. Mr. Aldous, for the defendant, urged that no liability could attach to the defendant for the extra work, which he had never ordered to be done. What business had a builder to do work which the landlord had not instructed him to do? Mr. Commissioner Kerr replied that if a sanitary inspector required work done a builder was bound to do it. Under the Sanitary Acts a landlord was liable for such work, although he did not

SOHO COWL
AND
VENTILATOR

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to any one suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

give any order. Mr. Aldous argued that the defendant, as the landlord of the property, should have been communicated with. Mr. Commissioner Kerr said that if that had been done and the defendant had not given the instruction the sanitary inspector would have taken him before a magistrate, who would have made an order. It was no use opposing sanitary inspectors when they wanted necessary work done. It was for the public benefit. Mr. Gathercole, the sanitary inspector, said the work was done on his verbal order. He had not to serve the landlord with written notice. Mr. Aldous contended that without a written notice the statute had not been complied with. Mr. Commissioner Kerr said he could not hold that. The defendant could not get out of it. There must be judgment for the plaintiff for the amount claimed, with costs.

THE SANITATION OF HOUSES ON THE RIVIERA.

A "Winter Resident on the Riviera," in a letter to the *Times*, says:—As people are now preparing to go to the Riviera for the winter it may be opportune to call attention to the sanitary condition of most of the houses they will find there. Last year, before going out, I let my house in London. The tenant, before taking it, had an exhaustive examination by an expert, and it was necessary to show by a very stringent test that there was no possibility of the escape of sewage or sewer-gas into the house or the adjoining soil. This represents the sanitary standard in England. On arrival at my destination on the Riviera I found a house of an expensive character being built in a very good situation. In the middle of it, in the basement, was a great pit. Inquiring the object of this I was told it was the "fosse" or cesspool for the whole house. The pipes that led into it from the closets were very large and of rough earthenware, with very imperfect joints, and they were all inside the house. I was told that this was quite a common construction. A friend of mine, who had an examination made of a house he proposed to take, was told it was in the best sanitary condition, so much so indeed that "not a drop of sewage could escape outside the house." Examining a house myself later on with a view to hiring it for the year, I found the cesspool partly outside and partly under the house, the soil-pipes coming down inside the house of the very roughest construction, and no pretence of a syphon trap; an inch or so of water in the pan was supposed to

provide all necessary security against the admission of sewer gas. The owner was indignant at being told this was all wrong; the English, he said, were mad about microbes; he had always let the house, and he would do nothing. The English doctor informed me that 99 houses out of 100 were no better. The same people who insist on excessively stringent tests before taking a house in London go gaily into such a house as I have described on the Riviera. Perhaps they would not do so if they knew the facts which I have set forth above.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 20407. Thomas Garforth Rhodes and Raymond Gaunt for "Improvements in apparatus for silencing the noise in flushing cisterns."
- 20414. William Thomson, for "Improved glass tiles."
- 20417. John Taylor, for "Improved joint for sewerage and other pipes."
- 20423. Samuel Bott, Charles Turner and David Holmes, for "Improvements in latches for doors and like purposes."
- 20426. Henry David, jun., for "Cupboard turn or turn-buckle, or door knob and spindle."
- 20432. James George Hall, for "Improvements in *portière* or door curtain rods."
- 20447. Samuel Ticklemore, for "An improved door-step whitener."
- 20454. Dolvan Barnabus Akard, for "Door opener and closer."
- 20491. Robert Simpson, for "Improvements relating to the building of arches upon metal girders or wooden beams."
- 20518. Henry Igel and Frederick Henry Young, for "Improvements in valve taps."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

READING CASES FOR THE ARCHITECT.
Price 2s. Office: 75 Strand, London, W.C.

GENERAL HOSPITAL, BIRMINGHAM.

WE have received from Mr. Alfred Whitehead, 35 and 36 Prudential Buildings, Leeds, illustrations showing portions of the new General Hospital, Birmingham, the ceramic decorations in which he has carried out in eburite and majolica faience. They include the large waiting-hall, which is treated with a dull or eggshell-glazed material, and is an important work carried out in a thoroughly satisfactory manner, and the doctors' and patients' entrances, some of the bath-rooms, lavatories and dispensary. In addition to the above, Mr. Whitehead is also carrying out extensive decorations in eburite faience ware at the new theatre, Winter Gardens, Morecambe, the Oldham Joint Stock Bank, Shaw, near Oldham, the large hall, library, &c., at the Brunswick Rooms, Whitby, and many other places. Amongst the many important works he has carried out, we may mention the exterior faience works at the new Grand Arcade, Leeds; exterior faience treatment of ground-floor, Queen's Hotel, Leeds; also at General Infirmary, Leeds; new hotel, Goole; new court-house, Pateley Bridge; new premises, Upper Priory, Birmingham, &c. We have received a sample of Mr. Whitehead's ceramic decoration, which has a very artistic and pleasing effect.

(*accepted*) £13,276 0 0**TRADE NOTES.**

THE Aspley Heath Board schools, Woburn Sands, Beds, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special inlet tubes.

MR. L. NICKLIN, of the Smethwick Ventilating Company, Despatch Works, High Park Road, Smethwick, has just supplied his patent cowls for the ventilation of the Higher Grade School, Swansea. The Soho Cowl (Nicklin's patent) is being largely adopted by leading architects and contractors throughout the country, in consequence of its simplicity and the moderate rate of cost.

THAT pumps can be worked noiselessly is proved by Messrs. Merryweather in their patent triangular and compact pump recently fitted up at Hatfield House, the seat of Lord Salisbury, Lord Rothschild's house in Piccadilly, and other establishments. Hotel visitors are so numerous now to what they were a few years ago that the study of the pump and its noises becomes one of the greatest considerations as far as the comfort of the visitor is concerned. We must congratulate Messrs. Merryweather on their patent pump, and commend it to architects and engineers, whose aim should be to please their clients with a noiseless piece of machinery.

A CONTRACT for the pewing of St. Giles's Church, Newcastle, Staffs, has been made with Messrs. Jones & Willis, of Birmingham, and for the present seating accommodation of chairs, which has served that purpose since the opening of the church in 1875, there will be substituted a permanent seating

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

of open benches in oak, the design being in harmony with that of the fine church, which is one of the last examples of the late Sir Gilbert Scott's work. The present contract includes the pewing of the nave, three stalls of special design being provided on the south side for the use of the Corporation on the occasion of their visits to the church. The seat for the Mayor is appropriately distinguished among these. The work is being carried out from the design of Mr. J. Lewis, architect, of Newcastle, Staffs, and the cost will be defrayed by Mr. Edward Turner, a member of the congregation, who has before made other munificent contributions to the fabric and furnishing of the church. The special object of the gift is to commemorate the Diamond Jubilee of the Queen in the mother church of the town.

ELECTRIC NOTES.

A SPECIAL committee on electric lighting at a meeting of Leith Town Council was held on Tuesday last, when Mr. W. A. Bryson, consulting engineer, 11 Bothwell Street, Glasgow, was elected resident engineer at a salary of 300*l.* per annum.

A MEETING of the electric-lighting committee of the Dublin Corporation was held on September 23 in the City Hall for the purpose of considering a scheme for the improvement and extension of the supply of electric light in Dublin. It was decided to retain the services of a London electrical engineer and to make a suggestion to the Municipal Council to borrow 100,000*l.* for the construction of a power station at the Pigeon House Fort.

THE new installation of electric light at Boston Dock was officially opened on the night of September 22. The dock and premises were illuminated by eight arc lamps and 150 incandescent lamps, and an illuminated electric device on the walls of one of the large granaries bore the Boston motto, "Per mare per terram," composed of 168 clustered lights. The lighting of the dock was much superior to that afforded by the old gas lamps. The work has been carried out at a cost of 1,682*l.* 13*s.* 11*d.*

AT a meeting of the watch committee of the Bootle Town Council, held recently, it was reported by the town clerk (Mr. J. H. Farmer) that notification of the approval of the Board of Trade to the system of supply of the electric lighting in the borough had been received. The plans bearing on the scheme will at once be proceeded with.

BUILDING AND BUILDERS.

THE last section of the scheme for the building of St. George's Church, in the Meadows district, Nottingham, was entered upon on Thursday, when a memorial-stone was laid by Sir Charles Seely.

THE foundation-stone has been laid of the mission-hall being erected in Overton Road in connection with St. Peter's Episcopal Church, Kirkcaldy.

THE Holbrook Convalescent Home, associated with the Derby Royal Infirmary, is to be rebuilt at a cost of 5,000*l.*

BRUSSELS is to have a permanent memorial of the Diamond Jubilee in the addition of a much-needed chancel to the edifice of Christ Church, of which the first stone was laid by Her Majesty's representative, Sir Savile Lumley, afterwards Lord Savile. An inscription recording the great event of the Jubilee will be placed in the new chancel as the most appropriate memento of its erection.

A NEW Presbyterian church in Gordon Road, South Byker, the first place of worship to be erected in Newcastle under the scheme of church extension inaugurated by the Synod of the Presbyterian Church of England in 1895, has just been opened.

THE foundation-stone of additions which are to be made to the church of St. Andrew, Porthill, Wolstanton, has just been laid. The extension will consist of a south aisle, transept, vestry, south entrance and porch. The new building will be of stone, to correspond with the existing structure, and the contract, which is for 780*l.*, has been let to Messrs. Yorke & Goodwin, of Tunstall. Messrs. Wood & Hutchings, architects of the present church, have drawn the plans for the extensions.

SANITARY CONGRESS, LEEDS, SEPTEMBER, 1897.

THE HIGHEST HONOUR. SILVER MEDAL AWARDED.

THE "FRYSTON"

SIMPLEX OR DUPLEX FIRE. SUCCESS IN COOKING GUARANTEED.

Made in all types, either Leamington, as shown, or Yorkshire type, with high and low oven, from 4 ft. 3 in. wide by 4 ft. 6 in. high, to almost any size, or of the Restaurant and Hotel class, with any number of ovens.

Also made in small sizes with one oven, and with either side or back boiler, from 3 ft. 6 in. upwards, with one oven and either back boiler and hot hearth with rings and plug, or side boiler.

VARIETIES.

THE restoration of the church at East Markham, near Retford, which was commenced last June, the cost of which is being defrayed by the Duke of Newcastle, is almost completed. In taking up the old floor the original altar stone was found.

THE foundation-stone has been laid of the new schools at Ten Acres, in connection with St. Stephen's Church, Selly Hill, Birmingham.

THE parish church of St. Mary, Long Crendon, Bucks, was recently broken into and an attempt made to set the building on fire.

THE new chancel of St. Andrew's Episcopal church, Wishaw, was dedicated by the Bishop of Glasgow and Galloway.

AT a special meeting of the Rochdale Town Council, Mr. James Leach, solicitor and deputy town clerk, was appointed town clerk to the borough at a salary of 500*l.* per annum.

IT has been decided to place a memorial of the late Bishop of Wakefield in the church of St. Mark, Noel Park, North London, which church Dr. How founded while he was Bishop of Bedford.

THE interesting old church of Stanway, near Winchcombe, on the Gloucestershire estate of the Earl of Wemyss and March, was reopened on September 25, after complete restoration, of which the cost has been about 2,000*l.*

A MOVEMENT is said to be in progress for the formation of an association of architects in Aberdeen similar to those that have been formed in southern cities. Arrangements are so far advanced that it is expected the new society will be inaugurated early next month. There are thirty-four architects in business on their own account in the city.

NO fewer than three chapels have been recently closed in the centre of Birmingham, and a few days since one was sold by public auction. The organ fetched 14*l.* and the pulpit and seats a fair sum. One of the closed chapels is being used as a boxing-saloon and another by Socialists.

WHAT was probably the last tollhouse in London has just been demolished in the Westminster Bridge Road, where the South-Western Railway Company have been making some extensive clearances for the widening of their line between Waterloo and Vauxhall. The tollhouse in question admitted into Lambeth Marsh, but, of course, had long since been put to

other uses. An inscription, however, had been placed on the front, which gave the history of the house.

THE Congregational church in Melbourne Street, Stalybridge, which had been closed for alteration and decoration, was reopened on Monday last. New choir stalls of oak have been erected, and a fine pulpit of oak with a stone and marble base—a memorial of the late Mr. John Cheetham and his wife—has been placed in the church by Mr. J. F. Cheetham and Miss Cheetham, their son and daughter. Greater space has been gained in the nave by setting back the gallery front, which has hitherto shut off much of the light, and the whole church has been decorated in quiet colours.

THE new rooms of All Saints Church, Cockermouth, were opened on September 23. They have been built on the site of an old grammar school which had stood in the churchyard since 1564, and was carried on until about fifteen years since. The building, which has cost some 1,500*l.*, is a handsome structure, built in Elizabethan style. It was designed by Mr. G. D. Oliver, the county architect, and in addition to the parish room, which accommodates nearly 300 people, has two classrooms, two retiring-rooms and a kitchen. The contract was carried out by Mr. John Bolton, building and plastering; Mr. P. Robinson, joinery and painting; Mr. Bell, plumbing; Mr. J. Walker, slating; while the heating apparatus was supplied by Messrs. Walker, of Newcastle-on-Tyne.

THE members of the North-Western and Midland Sanitary Inspectors' Association held a meeting at Manchester on September 25. The chairman, Mr. Urquhart, of Crewe, in submitting the report of the delegates to the Leeds Congress of the Sanitary Institute, congratulated the Association on the fact that Dr. Farquharson, M.P., had promised to assist the progress of the Local Authorities' (Officers) Superannuation Bill in Parliament, that a sanitary inspector had for the first time been appointed president of the sanitary inspectors' section of the Congress and that sanitary inspectors were granted an opportunity of reading papers in other sections. In the course of a discussion on the report strong complaint was made of the meeting-place assigned to the sanitary inspectors at the Congress, it being contended that the value of the conferences was much lessened through the acoustic defects of the room. Mr. Bland, of Urmston, spoke in favour of a united organisation covering the British Isles. A statement was made to the effect that next month a conference would be held in Birmingham with a view to raising the status of the inspectors there and improving the position of the Association.

BACK-TO-BACK HOUSES.

At the Sanitary Congress a paper on "Operating the Housing of the Working Classes Act in Leeds" was read by Mr. George F. Carter, C.E., assistant engineer, which described the steps being taken by the Corporation to clear the York Street and Camp Field insanitary areas. It was proposed, he said, to deal with the York Street area as follows:—The buildings on the first section of the area would be demolished, and dwellings afterwards erected for the accommodation of 500 persons of the working class. The second section would then be cleared, and provision made for another 500. Then the third section would be dealt with, and provision made for 1,000, or in all a total provision of 2,000 persons of the working class. Afterwards the fourth section would be cleared. All dwellings, whether erected by the Corporation or by private enterprise, must be in accordance with plans approved by the Local Government Board. It was not intended that all the accommodation should be in the area itself; and as there might be some residents who, if suitable small through houses were erected on cheap land nearer the suburbs, would avail themselves of the same, the committee had determined to arrange for the erection of about 100 houses (to accommodate about 500 persons) upon a part of the Ivy House Estate, belonging to the Corporation. The type of house it was proposed to erect would contain suitable accommodation for a working-class family, comprising a good-sized kitchen or living room, a scullery with copper fitted in, two good bedrooms on the first floor, an attic, and a cellar for food and coals, or an outside pantry. Each house would have its own back yard, w.c. and ashpit. With regard to the remaining 1,500 for whom accommodation must be made, a great question opened itself out, as some effort must necessarily be made to supply suitable accommodation for the very poorest class. The area itself, from its position in the town, and especially its proximity to the public markets, was one in which many of this poorer class preferred to reside. The truth of this was proved by the present overcrowded state of the area, and also the fact that there was scarcely an empty house in it. There was great need in Leeds for some really good common lodging-houses, where for about 4d. or 5d. per day a person could have the use of a private and properly arranged cubicle to sleep in, and it had been suggested that the Corporation should erect such a lodging-house to accommodate about 500 persons. It was proposed to accommodate the remainder of the people displaced in tenement

dwellings and specially arranged through houses on the area. The ordinary tenement blocks would not exceed four storeys in height

Dr. Muntz (Belfast) said he was glad to see that the Local Government Board would not permit the Corporation to erect back-to-back houses in place of those to be demolished. The Leeds authorities had a very difficult problem to deal with in these insanitary areas. He thought they would always find it better to take a small area in hand rather than a large one, because they would so reduce the opposition they had to encounter. It was desirable to drive one long street through such an area, but it was a fatal mistake to make it too wide, because if they did so they would spoil it for shop purposes. In one case in which he was concerned they widened a street to 65 feet, but it would have been better to make it 55 feet, because, when wider, it became practically two different streets. Generally speaking, the main street should be of such a width as to take in a double line of tramway, with sufficient space for ordinary traffic on either side. The very large number of them was one of the difficulties of housing the working classes in Leeds. To accommodate them in tenements was just the thing that should not be done. It would be crowding so many individuals upon so many square yards, and that was not the way to make healthy towns. It was better to have the central portions of the city entirely used for manufacturing purposes, and for the people to live in the purer air outside. It could be easily managed, because from inquiries made that morning he found land was not so dear around Leeds as he had imagined. It could be bought for 3s. per square yard in fee. That worked out at something like 750l. per acre, in fee, or 37l. 10s. per acre per annum. Houses could be built on land obtained at that price that would pay 10 per cent. if properly managed, and it was being done in other places.

Dr. Gordon Beveridge (Aberdeen) said he disagreed with Dr. Muntz on one point. His (Dr. Beveridge's) objection to the Corporation scheme was that it was not large enough. If they could remove the displaced population to the outskirts of the city they could give them better accommodation than would be possible in the centre, and they would avoid the introduction into Leeds of the odious Scottish system of huge tenemented houses. They would also place their scheme on a more sound financial basis, because they could acquire land at a cheaper rate outside, and could easily persuade the railway companies that there was money in providing proper facilities.

Dr. Aston (Ecclehill) said he noticed from the plans that

EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,
LONDON, N.W.

the drains of the houses went direct to the main sewer, and this was contrary to the model by-laws of the Local Government Board. Another criticism he had to offer was that the scullery opened out of one of the bedrooms, and he did not think that was sanitary.

Councillor Womersley said, with reference to back-to-back houses, that there was no comparison between the older specimens and those more recently erected. Fewer objections could be raised against the latter, especially when they took into consideration the enhanced value of land in Leeds. They might be able to get land on the outskirts at 3s. per yard, but the difficulty was to get the people there. Let him say, however, that the Corporation were doing their best in that direction by running early morning trams from the outskirts for the convenience of the workmen. But there was a class of people who would be practically deprived of their livelihood if they were removed from the centre of the city. Those employed casually in and about the markets, for example, who had no certainty any day of getting work, could have no chance at all of doing so unless they were on the spot very early in the morning. The committee wanted therefore to avoid if possible removing them too far from the centre of the city. In the end, he thought, they would adopt some form of tenement house. It would not be a very high one, for, remembering the prejudice there was in Leeds against such dwellings, they would not soar so high as their friends in Scotland in that respect. He would ask their critics to try and realise what it meant to have to deal with 72 acres of land in the centre of a great city like Leeds, and to house and rehouse 15,000 people. Let them think of the enormous opposition that would be engendered by the mere fact of issuing notices to quit upon 15,000 people. They had not bought sixpennyworth of property yet. Their trouble had already been enormous, and he did not like to think of what it would be by the time they had acquired the property. He confessed he felt rather depressed about this huge scheme, and he would rather their friends had encouraged them than that they had suggested that it was not bold enough.

Alderman Harrison, chairman of the health committee, Sunderland, said that his Corporation, in clearing an insanitary area, divided the work into three portions and proceeded by steps. They instructed the borough engineer to value the whole of the property involved, and then had an independent valuation made by an estate agent. The two were found to correspond very nearly, and the committee therefore placed the matter in the hands of the agent with instructions to acquire the property

at as near his own valuation as possible. He secured a considerable amount, some at less, some at the valuation, and some at a little more, and they had now bought the whole property at a fairly considerable sum less than the original valuation. They submitted plans to the Local Government Board, and this placed them in a difficulty, for while on the one hand their effort was to do away with insanitary overcrowding, the Local Government Board insisted that the whole of the people displaced should be provided for on the area cleared, and they were driven to erect these high buildings that none of them liked. Their plans only showed three storeys, as against the four required, and the Local Government Board had not yet sanctioned them because they were unable to house the whole of the people on the area. That was a strong argument in favour of the local authority having absolute discretion in such a matter.

Dr. Walter Smith spoke of a similar condition of things in St. Pancras. They had a very large scheme before them, and the Local Government Board refused to allow them to go on unless they rehoused three-fourths of those displaced, and that was absolutely impossible, because every inch of ground for miles around was covered.

Mr. Carter, in replying, mentioned that the Leeds Corporation building by-laws contained no reference to tenement dwellings. If plans for such a building were submitted, he dared say they would be thrown out.

A BUILDING PROBLEM IN EDINBURGH.

THE completion of the North Bridge in Edinburgh makes it necessary to consider what is to be done with the sites for building along the new approach, and which will form a street that will be the connecting link between the Old Town and the New. Some members of the Council propose that the land should be sold in one or more lots, while others consider the interests of the city would be served if the Council decided on undertaking the erection of the new buildings, for which a general design was obtained in competition. The city treasurer, Mr. M'Crae, has prepared an elaborate report, in which he advocates the completion of the improvement by the Council. The following are the most important parts of the document:—

There are three different methods which may be followed

in carrying out the scheme. (1) The city may build on the scheduled area, and hold the property for behoof of the citizens; or it may, after building, sell the properties under burden of a feu-duty, which latter may either be sold for a capital sum or retained as a source of annual revenue to the city. 2. The scheduled area may be disposed of, as has been suggested, in separate lots, stipulation being made that the buildings to be erected thereon should conform to the plans approved by the city. 3. The scheduled area may be disposed of in one lot, subject also to the building plans approved by the city being adhered to. If either of the two latter methods is adopted, the first question that suggests itself is, What price can the city in equity accept as the purchase price of the ground? or, alternatively, what feu-duty would be the equivalent of the capital sum fixed upon as its reasonable value? And, further, how are we to arrive at what that sum ought to be? We have two factors which may help to solve the problem, viz. the cost of acquisition, and the value of the ground as a building site.

Cost of Acquisition.

The first point to be considered, however, is the cost of acquisition. Here we are on somewhat delicate ground, as a large part of North Bridge Street has yet to be acquired. We will, therefore, take the cost of acquisition at 300,000*l.*, although it is probable that the cost will be below that figure. If, however, this sum is taken in all the calculations, any saving which may ensue will apply equally to all three methods, and will not, therefore, affect the comparison. We will then have an estimated expenditure as follows:—

Estimated cost of acquisition	£300,000
Valuators' estimate for rebuilding	211,000
Total cost	£511,000

Financial Result considered on Basis of Rental, that is, the City Building and Letting the Properties.

We have next to consider the annual rental value of the property when erected. Here we are met with a conflict of opinion on the part of experts as to the rent which the property will produce.

The lowest estimated rental is	£19,500
The highest is	26,000

The mean between these two is 22,750*l.* One of our valuers, who has had great experience of this class of property, estimated

the rental at 22,000*l.* As this is, in round figures, the mean between the two extremes, it may be assumed as a fair rental. At least, I feel sure no business man will say that the estimate has been overstated, when he considers the trade possibilities of the widened thoroughfare, the main access between the old town and the new, with its breadth of 75 feet of roadway and pavement, its magnificent buildings situate in the very business centre of the city, and adjacent to the finest street in the world. A rental of 22,000*l.* per annum, subject to a deduction of 25 per cent. for taxes, repairs, &c., would produce a free rental to the city of 16,500*l.* per annum. The annual charge for sinking fund and interest on the annuity principle—viz. an equal annual instalment for principal and interest for the redemption of 511,000*l.*—the total cost of acquisition and rebuilding would be 18,000*l.*, calculated on a fifty years' basis, the term sanctioned by Act of Parliament for the scheme. This shows a seeming deficit of 1,500*l.* per annum. Against this, however, has to be placed the increased assessment which the city will receive from the new rental, which may be moderately stated at 1,750*l.* per annum, which gives annual surplus of 250*l.* for the fifty years during the liquidation of the debt. At the expiry of that period the city would receive a clear revenue of 16,500*l.* per annum, exclusive of the increased assessment. The architects who were successful in gaining the premium awarded by the Corporation for the best design estimate the cost of reconstruction, according to the plans prepared by them, and which have been taken by all the valuers as the basis of calculation at 172,000*l.* or 38,000*l.* less than the estimate made by the valuers.

If we take the figures of the architects, who, it may be presumed, are able to correctly calculate the cost of their own design, the result would be as follows:—

Estimated cost of acquisition	£300,000
Estimated cost of rebuilding	172,000
Total cost	£472,000

Estimated rental 26,000*l.*, less 25 per cent. for taxes, repairs, &c., 6,500*l.*, leaving a net rental of 19,500*l.* The annual charge for sinking fund and interest on 472,000*l.* would amount to 16,640*l.*, showing a surplus, exclusive of the increase in the assessment, of 2,680*l.* per annum. And at the expiry of the period allowed for liquidation of the debt, a free revenue of 19,500*l.* per annum would be received by the city. To avoid complication I have omitted any calculation as to interest to be paid during construction, as the amount would not materially

SPECIAL ATTENTION GIVEN TO ARCHITECTS' DESIGNS

affect the above conclusions, having regard to the manner in which the rebuilding would be proceeded with. The city would receive the rents from the properties acquired until their demolition, which would take place gradually, the scheme being completed in, say, four sections. On the other hand, if the ground were feued, a period would require to elapse before the first feu-duty became payable to allow time for building.

On the Basis of the City Building and Selling the Properties.

We will now consider the probable result on the basis of the city building and selling the property after reconstruction. Taking cost of acquisition and rebuilding at the larger figure of 511,000*l.* and the rental of the property at the smaller figure of 22,000*l.*, and the feu-duty at the very moderate sum of 6,000*l.* per annum, the result would be:—

Rental	£22,000
Deduct feu-duty of, say	6,000
Leaving	£16,000

This capitalised at twenty years' purchase would produce for the property alone a sum of 320,000*l.*, to which remains to be added the feu-duty of 6,000*l.* per annum, which capitalised at thirty-three years' purchase would give 198,000*l.*, a total of 518,000*l.* Deduct cost of acquisition and rebuilding, 511,000*l.*, which shows a surplus of 7,000*l.* I know I will be supported by the best expert opinion in saying that the above estimate of 6,000*l.* per annum for feu-duty is, considering the site, certainly not overstated. But I have been anxious to ascertain, in the event of the city rebuilding the area in question, the worst possible result which could follow such a course. I am firmly convinced that, making all possible allowances for contingencies, the result of the city undertaking the work under the most unfavourable conditions would be that the return would meet the cost of acquisition and rebuilding. If, however, we take the architect's figures, we have the following startling results:—

Rental 26,000 <i>l.</i> , deduct feu-duty 6,000 <i>l.</i> , leaving 20,000 <i>l.</i> , which, capitalised at twenty years' purchase	£400,000
Feu-duty, capitalised at thirty-three years' purchase	198,000
Cost of acquisition and rebuilding	£598,000
Surplus	472,000
Cost of acquisition and rebuilding	£126,000

It will be generally admitted that twenty years' purchase for

property in the new North Bridge Street is too low, but I have been most anxious, as in the case of the feu-duty, not to over-estimate the value.

If these calculations are accurate—and they have unquestionably been taken on the safest possible basis—it follows that if the city should resolve to expose the ground for sale before building, the lowest price which the city could accept to be in the position it would be under the former estimate would be 307,000*l.*—viz. the purchase price paid by the city for the acquisition of the property and the estimated surplus of 7,000*l.* If the architect's estimate is realised—and I see no reason for thinking that the result indicated is unattainable—the value of the site to the city is 426,000*l.* If the foregoing calculations are carefully weighed, it is evident that in no case could the city incur serious loss in undertaking the completion of the scheme, while it is extremely probable that a surplus would be obtained. To the above calculation must be added the capital value of the increased assessment, which may be taken at 52,000*l.* As this will accrue to the city whichever course is followed, it has not been included in the foregoing calculations, but will go to the credit of the scheme when considering the financial results of the scheme as affecting the ratepayers. It will be at once apparent that should the Council resolve to dispose of the ground in one lot, or in several lots, the upset price must be greatly in excess of any sum hitherto mentioned. It will not suffice to proceed on mere theory as to the wisdom or unwisdom of the city building without fairly facing the consequences of the alternative.

Selling or Feuing the Site to Outside Parties.

Having arrived approximately at the value of the site, let us now consider the advantages of exposing the ground for sale, supposing a sufficient price could be obtained. One obvious advantage is that the city would be relieved of all responsibility as to the further progress of the scheme, and in these days of ever-increasing demand on the time and energy of the members of Council which the extension and development of the city entails, that is no small gain.

The objection urged against the case is a serious one, namely, that exposing the ground in one lot limits unduly the number of probable purchasers, leaving the city very much at the mercy of the speculator, who alone could undertake a risk involving such a large capital outlay for the purchase of the ground, not taking into account the additional capital necessary to rebuild the area. It is evident that only such a price as

would leave a large margin of profit to the purchaser would be obtained if the area is thus exposed. The proposal to expose the ground in lots so far meets the last-mentioned objection by enlarging the field from which purchasers may be drawn. The advantages which would follow the adoption of this course have been already referred to. There are, however, obvious objections which perhaps have been overlooked. In the first place, the contention that by exposing the ground in lots you thereby increase the number of purchasers is less real than it seems. The character of the buildings, which must be worthy of the site and in keeping with the new North Bridge, does not permit of the breaking up of the area into small lots. A careful study of the plans makes it apparent that the lots cannot be so divided as to bring them within the reach of the ordinary trader, who would hesitate to become responsible for the erection of a large pile of buildings, far in excess of his own requirements. We are met face to face with this difficulty, that although we have somewhat increased the number of competitors by exposing the area in blocks, we will still have the middleman to deal with. It will, with few exceptions, be the speculator and not the trader who will form our market. It is needless to observe that here also the price obtained by the city can only be of such amount as will leave a large profit to the purchasers, to which they are justly entitled. Then follows the problem:—If the area is to be exposed in lots, how are the unremunerative parts to be dealt with? Is the city to sell all it can and make the best possible use of the remainder, or is it going to jeopardise the sale of the choice portions by tacking on to them those less valuable? But granting that the city were able to dispose of the ground under the most favourable conditions as to price, it is not too much to say that the task of securing adherence to the general plan, if the area is disposed of to different parties, is well nigh insurmountable, however stringent the conditions imposed. The way in which back portions of the ground dovetail into the frontages, the variety of detail in the interior arrangements, provision for light, air, &c., affecting to a certain degree the elevations, comparatively easy of adjustment so long as the whole design is under one control, will lead to endless trouble and confusion and expense if the city once lose grip of the undertaking. I feel assured that the proposal to sell the ground in lots, plausible as it at first sight appears, would be less advantageous to the city than if the ground were sold to one party, who would be responsible for the execution of the work to the satisfaction of the city.

Objections to City Building Themselves.

What are the objections urged against the city completing the scheme? So far as I can gather they are as follows:—First, that the Corporation would not do the work efficiently or economically; secondly, that it is entirely foreign to the duties of the Corporation and outwith its province. The first objection arises from a total misconception of the proposals made. If the Council resolve to rebuild North Bridge Street, they will not themselves be the contractors for the work employing their own workmen. They will proceed exactly as they did in rebuilding the North Bridge—advertise for contractors to carry out the work, and in this case there would not be one, but several contracts, proceeding simultaneously if necessary. The rebuilding of the North Bridge has been most satisfactorily accomplished, although carried out by the Council. The electric lighting of the city has been an unqualified success, carried out by the Council. The conversion of the tramway system from horse haulage to cable, involving with extensions an expenditure of 400,000*l.*, is being carried out by the city's contractors in a most efficient manner. The plea that the city would not be competent to carry out the work is not only not complimentary to the business capacity of the Council, but is quite at variance with established facts. The other contention, that it is outwith the province of the Council to undertake the work is equally fallacious. The argument is entirely the other way. The Council, under statutory powers, are undertaking a great city improvement. The carrying out of the scheme to its logical conclusion involves the rebuilding of the area. The reconstruction, instead of being in the nature of a speculation, is consequent on, and part and parcel of the scheme following on the rebuilding of the bridge and the widening of the street. Nor can we leave out of account the great advantage of the city having direct control of the buildings during construction. The building scheme could be carried out strictly according to the elevations, the interior plans being adapted to meet the requirements of the tenants or purchasers, for the city would be ready to sell any part of the property on suitable terms. And here evolves the fundamental difference between the two methods of procedure. It is only after the area has been utilised that its real productiveness can be gauged. It is only after it has been covered by buildings that its capacity can be exhausted. No real equivalent can or will be received for it merely as a building site, even with its prospective capabilities. The selling of the area, either in one lot or in several lots, before the city had acquired the whole, however carefully the conditions of roup were framed, is

attended with considerable difficulty. Were the city to resolve to proceed with the rebuilding, it could begin now with that portion of the area which has already been acquired.

WATER SUPPLY IN RURAL DISTRICTS.

A PAPER on "Water Supplies from Wells in Rural Districts" was read by Dr. Mitchell Wilson at the last meeting of the Sanitary Congress. The water supply in rural districts was, he said, still largely obtained from wells, many of which were of old construction and had been made with few, if any, safeguards against pollution of the water from impurities in the surrounding subsoil. The Public Health (Water) Act, 1876, by its limitation of the amount of cost which a district council could enforce in order to obtain a safer supply through the construction of wells, prevented wells being made of a better class. Such improved wells had, however, been adopted by the sanitary authorities and voluntarily by private individuals with highly satisfactory results. Specially designed well tubes consisting of glazed sanitary tubes from 30 inches to 3 feet in diameter had been largely adopted in the rural districts to the east and south of Leeds. As the socket was fixed on the inner side of the pipe, the outer surface was smooth and offered little hindrance to the tube sinking. It was believed that a well made with such tubes was more secure against impurities than when bricks were used. Another method frequently adopted was to obtain water from the deeper strata when the geological formation was favourable. The water was reached by boring in the usual way. From 60 to 200 feet was the average depth in these districts needed to reach the new red sandstone rock, which usually yielded a good supply of wholesome water. As an additional precaution, the lining tube was often carried above the level of the ground, and the suction tube of the pump was directly connected with the lining tube. Such wells could not be provided within the limits of the Public Health (Water) Act. Experience had shown that to be quite successful the work ought to be carried out by a thoroughly competent well-sinker. At present there were no by-laws or official specification for the guidance of those advising upon, or actually engaged in, sinking wells. Matters of far less importance were regulated by by-laws, and much of the unsatisfactory work in the sinking of wells was due to ignorance of the scientific principles and newer methods based upon these,

which could alone provide a supply of wholesome water from wells.

Dr. Thresh, medical officer of health, Essex, read a paper on "Water Supplies for Rural Districts and the Means of Protecting them from Contamination." Increased attention, he said, was now being given to the question of providing rural districts with abundant supplies of wholesome water. Past neglect had been due to two sets of causes. The first was the ignorance of our rural population. The second was the general apathy of rural sanitary authorities. He had found in many districts that there were springs yielding considerable quantities of wholesome water running to waste, when within a mile or two there were villages badly in need of such a supply as those springs afforded. In other instances the subsoil contained and was capable of yielding an abundance of water, which, if properly collected and protected from pollution, would supply all the wants of the inhabitants of the neighbourhood. There were, however, many localities destitute of springs and with an impervious subsoil, but even in those places it was often possible to find and obtain water below the impervious stratum and at a reasonable depth. Where such was not the case, the attention had to be turned to the possibility of impounding surface water from a suitable collecting area. Where springs were available and the water rose at a sufficient elevation to supply the districts by gravitation, they formed by far the most economical source of supply, as there was no annual outlay for pumping, and the necessary storage was but small and of the cheapest character. Where the flow was sufficiently abundant, but the elevation insufficient, a ram, turbine, water-wheel, or even a windmill, might frequently be utilised to raise the water. The subsoil as a source of water-supply had unfortunately fallen into disrepute, because the water from shallow wells (all of which was derived from the subsoil) was so generally polluted. He was convinced, however, that in most districts a perfectly wholesome water could be obtained from the subsoil, by selecting a suitable site and obtaining water by aid of a tube well or a properly constructed shallow well. Where the only available source of water was from a permeable stratum lying under an impervious one, the expense incurred would generally be considerable, especially if the upper layer was 300 or more feet in thickness. The water would probably be of a high degree of organic purity, but it might contain sufficient iron, magnesia or other objectionable matters to render it useless. There was always more or less risk involved in deep-well boring either with regard to the quality or quantity of water procurable;

hence a skilled hydrologist should always be consulted before deciding upon attempting to obtain water from such a source. In fact, wherever there was any uncertainty about the quality or character of the water procurable, an expert should be consulted, but by an "expert" he did not mean the advertising expert who professed to find water by the aid of a hazel-twigs or other similar means. To prevent the contamination of a water-supply the situation should be carefully selected, and the surroundings should receive constant attention. If a spring had to be purchased, rights should be acquired over a sufficient amount of the ground above the spring to enable the authority to protect the water and insure its purity. Where water was collected from a fissured stratum, it must be remembered that impurities might travel great distances in such fissures. When surface water was being collected, strict watch must be kept over the whole of the collecting area. An uncultivated, uninhabited surface was the best, and in any case some considerable area around the points of collection should not receive manure of any kind. Rain-water collected from the roofs of outbuildings and houses would always be impure unless some system was adopted of rejecting the washings of the roofs. Wherever a water-supply was affected by a heavy rainfall, so as to show any turbidity, it was evident that there was something wrong, and a careful investigation of the cause should be made. In conclusion, Dr. Thresh said if they wished to prevent the exodus from our villages, or attract the town dweller to the country, they must provide better water-supplies, and do all in their power to remove the stigma which at present caused all intelligent people to look with suspicion upon all water-supplies in rural districts.

The president (Mr. Whitaker) said both Dr. Mitchell Wilson and Dr. Thresh had laid them under a debt of gratitude. Both had had considerable experience of wells in rural districts, so that their opinions should carry weight. Dr. Wilson said there was no official guide as to sinking a well. He had been a Government official for a considerable time, and he looked with suspicion upon official guides. He was of opinion that the county councils might do something in that direction. Dr. Thresh's remarks about the divining-rod were not far from the mark. It was a comparatively easy thing to conduct a research for the construction of large waterworks, but it was generally much more difficult to obtain practical plans for supplying small villages and towns. Very often the most perfect method was impracticable on account of the cost.

Mr. Herbert Peck said it was exceptional to find a shallow

well that was any good, and few deep ones could be relied upon for decent water. He had made nearly 1,000 analyses of well water during five years, and in less than 100 cases was the water of good quality. It was not an uncommon thing to find a well a few yards from a cesspool.

Mr. P. F. Kendall, F.G.S., of the Yorkshire College, said Dr. Wilson's recommendation of wells with bore-holes was exactly in accordance with his experience. He had met many cases where wells yielding an insufficient supply of water, when a bore-hole had been put down the centre afforded a much augmented supply. Geologists always preferred deep wells, because they were able to acquire much valuable information when they were being sunk.

Dr. Brown (Bacup) said little reference had been made to the merits or demerits of a supply of water from the roofs of cottages. A case came under his notice some time ago in which the water from a roof was collected in lead tanks. The result was severe cases of lead poisoning.

Dr. Anningson said the experience of Dr. Thresh was valuable. He would like to ask him how he got over the difficulty of the Local Government Board's objection to small water schemes. The President had referred to the necessity of an extended geological survey of the drifts. In attempting to obtain surface water it was useful to have some guidance as to the nature of the drift. It would be of great value to medical officers if they knew how to obtain water from gravel patches.

Dr. Mitchell Wilson, replying to the discussion, said one of the delegates had asked if they had had any experience in dealing with rain water. He had had a few years' experience of a fen district in Cambridge, where other water was absolutely non-existent. Rain water was very uncertain, and a drought meant a water famine. When any other supply was available it was advisable to discard rain water. He agreed with Mr. Kendall that it was necessary to bring the tubes of the well above the surface.

Dr. Thresh said he had been asked if he had had any experience of lead poisoning resulting from the water obtained from the roofs of houses. The county in which he resided was a very poor one. Any one who found lead about the roofs of the houses which he had to deal with would be a clever man. There were no leaden cisterns. The water was collected in old wooden tubs. He had been asked how he succeeded in getting the Local Government Board's consent to small schemes. He had had several battles with Local Government Board inspectors, and so far had been able to get much what he wanted

W. DUFFY'S PATENT IMMOVABLE ACME

WOOD BLOCK FLOORING.

THE PERFECT FLOORING FOR ALL PURPOSES.

Seven Gold Medals, four Silver, two Bronze Medals, and Certificate of Sanitary Institute of Great Britain.

Full Particulars and Prices on application to

THE ACME WOOD FLOORING COMPANY, Ltd.,
Chief Office and Works:—GAINSBOROUGH ROAD, VICTORIA PARK, LONDON, N.E.

HEALTH EXHIBITION, LEEDS.

THE Valveless Syphon Company, of Kirkstall, have a most interesting display of their goods. First and foremost is an improved pattern of their well-known "Waterwitch" syphon flushing cistern.

The syphon arrangement consists of a horizontal cylinder and syphon bend; the cylinder is fitted with a displacer which is worked by means of a bell-cranked lever operated by the pull; the piston gives the first flush only, then the water is drawn direct up the syphon pipe, and is so arranged as to practically take all the water out of the cistern. The working parts being all of brass and the cylinder of brass tube, a smooth and

reliable action is insured. The syphon is practically noiseless, and the cistern will flush with only 4 inches of water if desired. With a 4-foot fall and 1½-inch fall-pipe a three gallon cistern will discharge its contents in six seconds. A small silencing valve can be attached, which is adjustable for rendering the cistern silent for given fall of flush pipe.

A new syphon cistern, the "Neptune," is also shown. It consists of a vertical cylinder and syphon bend; the piston passes a side opening at the top of the cylinder in its upward course, and then forms its own valve, and being formed with a well which enters a projecting boss on the top of the cylinder inside, and being full of water it traps the joint, thus insuring a perfect full-bore flush by reason of being kept air-tight during the discharge, which is accomplished with the least exertion.

The "Waterwitch" ball-valve is a very ingenious, though simple, piece of work. The main feature is a loose, spherical valve-seat, which rights itself square to the valve-face, thus insuring a perfectly tight valve. At the same time the seating is as easy to renew as an ordinary ball-tap, and the spherical seating arrangement dispenses with all tight-fitting parts, thus reducing friction to a minimum. This ball-valve is an effectual cure for water-hammer.

Mr. H. Jackson, 134 Westfield Road, Leeds, is exhibiting his patent "Paragon" instantaneous water-boiler, which has decided advantages over many of those which are on the market. By means of the "Paragon" a continuous stream of boiling water at the rate of a gallon per minute can be obtained when once the boiler has been warmed by the flow of hot water, but even when cold the water boils within two minutes. It is fitted with a jockey-light, which when turned in to the burners turns on the gas, and when withdrawn cuts off the supply—thus gas is only consumed when the boiler is in use. The supply of cold water is regulated by a ball-tap, and by means of an overflow pipe the hot water cannot boil over but returns into the heater. The bronze medal of the Sanitary Institute was awarded the inventor at the Congress held at Leeds last month.

YORK COUNTY HOSPITAL.

THE new wing to be erected at the York County Hospital will occupy a piece of the garden on the south side of the institution, and is to be approached from a corridor which connects the Watt ward with the main block. It is to be a one-storey building and will comprise a children's ward for eighteen beds, 70 feet long by 24 feet wide, an inspection ward for two beds, a day-room, a ward kitchen and the usual offices, together with separate and detached lavatory blocks. Open to the south will

be a sun-room, with glazed roof, into which the beds of the patients can be wheeled, enabling them to enjoy the sunlight entirely sheltered from the winds. The buildings are to be fireproof throughout, the walls lined with tiles and the floors laid with teak. The roof will form a flat, which will be laid with asphalt, and to this the patients from the upper floors of the main building may have access. The whole of the new wing has been arranged by Messrs. Demaine & Brierley, the architects, upon the very latest and approved principles of hospital planning, and for this purpose Mr. Brierley visited some half-dozen of the finest hospitals in the kingdom before finally settling the plans. The foundation-stone of the new wing was laid by the Duke of Cambridge on the 23rd ult.

BUILDING INDUSTRIES IN RUSSIA.

A SERIES of articles from a correspondent in Russia is appearing in the *Leeds Mercury*. The following description of brick-making and shingling as practised in the provinces is curious:—

Brickfields are generally worked under a contract, in which the proprietor's contribution to the joint enterprise is the brick-field itself, the plant and the fuel. The labour is supplied by an "artel" of peasants, who take the contract for the season, the proceeds of the sale of the bricks being equally divided between the proprietor and the members of the artel. While speaking of brickmaking, I must relate an anecdote illustrative of the way in which superstitions arise. I was surprised to find that the bricks made by the peasants for their own use, and destined for the construction of their stores, were marked with a rude but perfectly recognisable representation of the British Arms, with the lion and the unicorn. On inquiring the reason for such a very marked compliment to our country in a remote part of Russia, I was informed that the lion and the unicorn were the emblems of two saints who, thus honoured, would they believed protect their "izbas" against the risk of fire. I afterwards discovered the real origin of the custom. For many years the best firebricks were imported from England, and many of these were stamped with the royal arms. Of late years the importation has diminished, but they are still held in such high esteem that Russian imitations are generally stamped in the same way. The peasants here, ignorant of the real meaning of the trade mark, in stamping the bricks made for their own use in the same way, were unconsciously perpetuating a fraud from pious motives.

Another industry carried on upon this estate and which is spreading in White Russia is the manufacture of shingle for roofing. The work is done upon the same partnership system, the wood and the machine—generally worked by oxen—being supplied by the proprietor, who shares the proceeds equally with the artel that undertakes the work. Machines for this industry are imported from Germany and also, I am told, from Belgium. Should any enterprising British firm manufacture such machines for the Russian market, they would have to be small in size, easily transportable, as simple as possible in construction and to be worked by hand, or for larger sizes the motive power to be given by oxen or horses. Shingle for roofing is of course manufactured on a large scale in regular sawmills, whence it is sent in immense quantities to the urban districts; but it becomes expensive when it has to be carted for long distances into remote parts of the country. Hence the demand for small machines to manufacture it locally with wood which would not be of any saleable value on the spot. This demand will certainly greatly increase on account of the action of the fire insurance companies, which accept shingle-roofed buildings upon far more advantageous terms than those covered with thatch.

A LABOURING man named Michael Harte was engaged in excavating gravel in a field near the Glen, opposite Tower Hill, county Down, about three miles from Newry, when he came across a large hole, which at first he believed was a rabbit warren. To his surprise, however, the bank gave way, and revealed a large cave or tunnel. Harte was so much astonished that he ran and informed Mr. M'Anuff, his employer, of what he had discovered. Mr. M'Anuff then secured the assistance of Mr. Samuel Downey, and together they entered the cave and explored it. To their astonishment it turned out to be a fine building about 25 yards long, in two compartments, about 4½ or 5 feet high and 5 feet broad; well faced on both sides with stone, and covered over the top with very large stones, some of which are over 3 feet broad. The passage was quite dry, the whole altogether forming a comfortable and secure place of concealment. It is believed the cave is only opened in the centre, and that it runs to the one that was discovered in the townland of Donaghmore some time since. The district of Donaghmore, Tormore and Benagh abounds with cairns, caves and mounds.

INSTITUTION OF CIVIL ENGINEERS.

THE prize list of the Institution of Civil Engineers for the session 1896-97, now made known, contains awards as follows:—The Howard prize of 50 guineas to Mr. Hilary Bauerman, in recognition of his work on the metallurgy of iron. For original papers presented to the Institution, Telford medals, with premiums of books or instruments, to Messrs. H. A. Humphrey, for "The Mond Gas-producer Plant and its Application;" to Colonel Pennyquick, R.E., for "The Diversion of the Parivar;" to Mr. E. C. Shankland, for "Steel Skeleton Construction in Chicago;" to Mr. Dugald Drummond, for "High Pressure in Locomotives;" and to Mr. Thomas Holgate, for "The Enrichment of Coal Gas." George Stephenson medals and Telford premiums to Mr. Cruttwell, for "The Tower Bridge Super-structure," and to Professor Unwin, for "A New Indentation Test for Determining the Hardness of Metals." Watt medals and Telford premiums to Messrs. Hay and Fitzmaurice for their joint paper on "The Blackwall Tunnel." The Telford premium list contains the names of Messrs. Donaldson, Ripper, Ravenshaw, Worth, Santo Crimp, Homfray, Nichols, Ramsay, H. D. Smith and Major Leach, of the Corps of Engineers, United States Army. Awards to students attached to the Institution comprise:—The James Forrest medal to Mr. A. H. Jameson, the Joule medal to Mr. H. W. Barker, and Miller prizes to Messrs. Beer, Brand, Berridge and Kitchin for papers read in London, and to Messrs. Godfrey and Garvie, of Manchester, Mr. Carter, of Newcastle, and Mr. Hurt, of Leeds. This year marks the first award by the Institution of the medals named after James Prescott Joule, the discoverer of the mechanical equivalent of heat, and James Forrest, whose long service as secretary and the care devoted by him to fostering the student class have on his retirement been commemorated by the foundation of this medal. The presentation will be made at the opening meeting of the session on November 2.

CHEAP SCHOOLS IN EASTBOURNE.

A NOVEL scheme is being floated at Eastbourne. The Education Department requires the provision of 400 additional school places. Mr. J. G. Langham, a local solicitor, proposes the formation of a joint-stock company to raise the funds required for additional buildings and to aid in placing the schools on a sound financial footing for the future. The promoters believe that the project, if speedily taken up, will keep out a School Board and yield a moderate return of interest to the investors. The Duke of Devonshire, Lord President of the Council, has taken shares to the amount of 500*l*. Mr. Davies Gilbert, the other local landowner, the Archdeacon of Lewes, the Mayor of Eastbourne and others have also consented to take shares. The capital is 10,000*l*. in 1*l*. shares. The proposal has been before the Education Department and no objection has been made to it. The hire of premises for school purposes, provided they are properly constructed to meet the sanitary and other requirements of the Department, is, in fact, recognised and the rent of such premises is allowed in the school accounts as a legitimate part of the annual expenses of the school. The scheme has also been laid before the Bishop of Chichester who has given it his sanction. The Duke of Devonshire has offered to convey to the company the fee simple of a site in Bourne Street in consideration of a rent-charge of 12*l*. a year. The cost of a school containing 400 places is estimated at 2,500*l*., and when built it will be let to a body of managers at a rent of 125*l*., equal to 5 per cent. on the capital. Deducting 25*l*. for management expenses, there will remain 100*l*. a year, or a clear 4 per cent. for dividend for the shareholders. The directors desire to raise 10,000*l*. in order to have a strong reserve to fall back upon as further needs arise.

ARSENICAL POISONING BY WALL PAPERS.

IN a note by Mr. Thomas Bolas, F.C.S., in the *Society of Arts Journal*, we read:—It has long been recognised that arsenical wall papers do serious mischief, but the work of Gosio and of Emmerling seems to have cleared up that mystery which has surrounded the matter. Certain moulds, including the very common *muco* *nucedo*, have a remarkable property of decomposing arsenical compounds with the evolution of volatile products containing arsenic, and the highly poisonous character of volatile arsenical compounds, coming into the system by way of the respiratory organs, is well known. Arsenious acid is, even in small quantities, a highly antiseptic substance, and poisonous to moulds, so the throwing off of the arsenic in a volatile form may be an effort of nature to cast out the poison. The arsenical copper greens and other colouring matters containing arsenic are still used, and, paradoxical as it may appear, it is by no means improbable that the most dangerous wall papers are those containing a mere trace of arsenic, as when the quantity is large the moulds cannot exist. Traces of arsenic may come into wall papers from the imperfect washing of

vessels used to contain the more highly arsenical colours. Now that boric acid is very cheap, the old and perhaps forgotten suggestion of Bolley to use a precipitated borate of copper as a green pigment in place of the arsenical green deserves attention. Bolley's green is prepared by taking two parts of blue vitriol (crystallised cupric sulphate) and three parts of borax in separate quantities of cold water and mixing, after which the precipitate is washed and dried. Dyed and printed fabrics now very frequently contain traces of arsenic.

RENTAL AND LAND VALUES IN LANCASHIRE.

A RETURN recently published gives the gross estimated rental and rateable value of agricultural land and of buildings in the respective counties under the Agricultural Rates Act of 1896. The return for Lancashire shows that the gross estimated rental of agricultural land is 1,227,082*l*., and the rateable value 1,147,066*l*., while the gross estimated rentals of buildings, &c., is no less than 22,907,186*l*., the rateable value being 19,009,640*l*. The gross estimated rental is 24,134,268*l*., and the gross rateable value 20,156,706*l*., or about five millions sterling in advance of the whole of Yorkshire, the next highest in the return. An analysis of the different unions in the County Palatine shows that the gross estimated rental of buildings, &c., in the Manchester Union is 1,827,506*l*., with a rateable value of 1,527,525*l*., the figures being those of the valuation list in force at Lady Day, 1896. In Salford Union the rental of agricultural land is 3,347*l*., and the rateable value 3,178*l*., while the estimated rental of buildings is 1,006,332*l*., and the rateable value 876,395*l*. In the Chorlton Union the estimated rental of the agricultural land is 11,173*l*., and the rateable value 11,168*l*.; the rental of the buildings is 1,576,512*l*., rated at 1,309,738*l*. In the Prestwich Union the agricultural land is rated at 77,082*l*., and the buildings at 566,573*l*.

ALRESFORD PARISH CHURCH.

IN a report on Alresford Church, Sir Arthur Blomfield says that on further examination he finds that the posts supporting the nave roof are in an extremely unsound state. One was split from top to bottom, and a collapse with a part of the roof falling might have occurred at any moment. The unsoundness of the posts was not visible, as they were cased. If the posts were removed it would be necessary to disturb a large portion of the roof-timbers, and as those are shaky and twisted it would be almost impossible to replace them. Under the circumstances he recommends that "columns and arcades with clerestory windows in stone, of a similar character to those existing before the fire, should replace the existing wooden construction." The estimated cost of an entirely new roof to the nave in oak, with nave arcade and columns and clerestory windows in stone, is approximately 1,000*l*. beyond the present contract. An interesting discovery of an Early English window has been made, and also extensive remains of windows of a Perpendicular church. The foundations of the new chancel are also found to be on exactly the same lines as those of the Perpendicular church, the latter having been brought to light in the course of the restoration.

A CURIOUS discovery has just been made at Heathfield Park, near Eastbourne, the seat of Mr. Alexander, of Lombard Street. On demolishing an old wall in the cellar the workmen found behind it 300 bottles of wine. It transpires that it was placed there seventy-one years ago by a former owner, who intended making it a present to his son on the latter attaining his majority. Death prevented the design from being carried out, and the existence of the store passed out of knowledge.

THE church of St. Martin-in-the-Fields has just emerged from the hands of the decorator, and was reopened on Sunday morning, September 26, radiant with fresh paint, varnish and distemper. The exterior in certain parts has for the last five years or so been hidden by scaffoldings for the necessary repairs, which necessitated the outlay of some 4,500*l*. The interior greatly needed renovating, but no funds being available, the idea was dismissed. The Jubilee, however, introduced it again, when Harrod's people paid 4,000*l*. for permission to erect stands round the church. Upwards of 2,000*l*. has been spent on the interior, the whole scheme of decoration in pale green, terra-cotta and gold, as well as the repairs, being placed under the supervision of Sir Arthur Blomfield. Without discarding the old pews, they have been made more comfortable by slight slope given to the back and by the addition of a shelf in front for the safety of the high hat. Unfortunately, street noises cannot be excluded, but sound has been deadened by covering the entire floor with linoleum. As St. Martin's was almost, if not actually, the first church in London to make use of the electric light, no improvement could be effected in this particular. A choir vestry has been fitted up in a corner crypt, which for a long time has been used as a gymnasium and recreation-room.

BUILDING REGULATIONS IN EASTBOURNE.

ON Monday, September 27, Mr. James Vine was summoned, at the instance of the building committee of the Town Council, for having contravened the building regulations in the erection of four houses in Cliff Road, Eastbourne.

Mr. H. West Fovargue, the town clerk, in opening the case, said that it would be well for the magistrates to view the premises. The complaint against the defendant was simply that he had erected the front main wall of the building, which was the subject of these proceedings, beyond the front main wall of the Convalescent Hospital. The defendant's building projected to the extent of 8 feet 3 inches beyond the front main wall of the hospital. The institution being built with bays, that might be made the subject of difference, but, allowing for any difference of this kind, it was still his contention that the defendant's building projected 4 feet 7 inches beyond the front main wall of the hospital. It was also contended by the Corporation that the assent of the urban authority was necessary to the erection of the building beyond the line of the adjoining building and that assent had never been given.

Mr. W. C. Field, building surveyor to the Corporation, stated that the plans deposited in April 1896 by Mr. Coster, on behalf of the defendant, for four houses in Cliff Road, were objected to, the notice of objection specifying that the drainage was incomplete and the building line infringed. In June 1896 new plans were deposited, showing the building line of the new building in a line with the front main wall of the hospital, and these plans were recommended for approval, subject to the removal of an old sewer at the rear. This latter matter had never been arranged, and actually no plans had been approved of by the Council, though had the plans of June, which were re-submitted in June 1897, been carried out, no objection would have been taken on account of the building line. Witness, finding that the building was being proceeded with, first gave notice to the builder, J. Holland, to discontinue the work, and on August 23, when first the measurements were taken, the defendant was present and heard the objections then raised by witness on the spot. Despite these notices the buildings had been proceeded with to the height of the second storey, and this prosecution was accordingly instituted.

In cross-examination, witness said the prosecution was authorised by the buildings committee, whose proceedings had not yet been approved of by the Town Council. This building was on the Duke of Devonshire's estate, but witness did not

know that the building line was fixed at 20 feet from the roadway.

Mr. Fovargue testified that this question, as to the examination and approval of plans and any prosecutions that might be necessary relative thereto, was entirely within the province of the buildings committee. In his opinion, while the Council could approve or disapprove of the proceedings of the committee, the resolution of the committee was sufficient for the present purpose, under section 6 of the Eastbourne Improvement Act 1895.

Mr. R. M. Gloyne, the borough engineer, stated that in his opinion the front main wall of the hospital was the wall erected at a depth of 28 feet 6 inches from a line indicating a fence or road boundary.

For the defence Mr. Hillman submitted an agreement specifying that the building line should be 20 feet from the roadway, and that a new building line ought not to be fixed by the previous erection of a building like the hospital, which was full of bays and excrescences. He also contended that the notice of objection given to the defendant's building was not sufficient notice to the defendant.

At this stage an adjournment was taken, during which the magistrates viewed the building.

For the defence Mr. James Coster, architect, manager to Mr. Holland, builder, stated that he prepared the plan, and it was understood that it was approved so far as the building line was concerned.

In reply to Mr. Fovargue witness admitted that he had no consent in writing from the building committee to proceed with the work according to the plan.

The Bench suggested whether a compromise could not be effected by taking away the two bay windows, and Mr. Hillman and the town clerk expressed their willingness to discuss the question. The case was accordingly adjourned for a fortnight.

THE SOUTH-WEST LONDON POLYTECHNIC INSTITUTE, CHELSEA.

THE operations of the Institute are divided into two distinct portions, day classes and evening classes. The technical day college is on the lines of the Finsbury Technical College, and provides a sound and systematic course of training extending over a period of at least two years in mechanical engineering,

electrical engineering or applied chemistry. It opened in September 1896 with only eight pupils, but before its first session was ended over seventy individual students had availed themselves of the excellent education offered by it. For those who are unable to attend in the daytime similar classes in the evening are available. Electrical engineering and applied physics seem to be subjects largely sought after in both day and evening classes. During the last session the physics and electrical engineering evening classes were attended by nearly 170 students engaged in one or more of the following subjects:—Applied physics, electrical technology, electric wiring and fitting and instrument making. None of the technical courses are run on examination lines, the object being simply to give the pupil that instruction which will best fit him for the occupation he has selected, but several of the students have highly distinguished themselves in the examinations of the City and Guilds Institute, whilst others have carried off evening exhibitions offered by the Technical Education Board. As regards equipment there is little to be desired. Thanks mainly to the London Technical Education Board something like 10,000*l.* has been spent on the plant requisite for electrical and mechanical engineering and for the apparatus required in the chemical and physical laboratories. The whole of the Institute is lighted by electricity, which can be generated by its own electric plant, or by the Chelsea Electric Supply Company. For the present session, which commenced on September 28, there are already a considerable number of entries in both day and evening engineering classes.

RESTORATION OF BRADFORD CHURCH.

A FACULTY has been granted by Dr. Tristram, Chancellor of the Diocese of Ripon, for the restoration of the Bradford parish church. About 3,500*l.* has been already raised towards the object, and the scheme of restoration was fully discussed at a Consistory Court held on September 22, the Chancellor presiding. It was stated that the scheme had long been in contemplation by the late vicar, Archdeacon Bardsley, and that twelve months was the proposed time for carrying it out, but this will probably be extended. The removal of graves and the reinterment of bodies, as also the diminution of the seating accommodation are the chief points which were involved in the inquiry, but the Chancellor said he had viewed the church and

had come to the conclusion that the alterations proposed were most desirable. The decision of the Chancellor has given general satisfaction, for it has long been felt that the old church needed restoration.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

21093. Alfred Ernest Barnett, for "Improvements in the method of, and means for repairing gas, water and other pipes and mains."

21020. David Muir Nesbitt and Walter Clowes, for "A combined water-heater and steam-condenser for water-boilers and the like."

21043. Arthur Bentall Collis, for "Improved water-tube boiler."

21048. John Johnston Green, for "Improvements connected with the pans of waste water-closets."

21056. John Walter Hacking, for "Improvements in the method of, and means employed for fixing scaffolding and all pipes or ladders to buildings or chimneys."

21141. John Alcock Jones, for "Improvements in manufacture of plaster for walls, ceilings and the like."

21169. Elias Samuel Ashcroft, for "Ball gully for the prevention of back pressure in drains."

21264. James Jemson, for "Improvements in or relating to slates for roofing."

21426. David Thomas Haylock, for "Improved method of laying drain pipes."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITIONS OPEN.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500l., 300l. and 200l. respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

COLNE.—Oct. 20.—Premiums of 50l. and 35l. for plans for technical schools, public library and public hall. Mr. T. H. Hartley, borough engineer, Colne.

DORKING.—Oct. 13.—Plans and estimates are invited for the erection of an infirmary. Mr. George Scales, clerk to the Guardians, High Street, Dorking.

SOUTHEND-ON-SEA.—Nov. 20.—Plans invited for new church. Rev. E. E. Kimber, St. Albans, Avenue Terrace, Southend-on-Sea.

UXBRIDGE.—Oct. 30.—The Uxbridge Rural District Council invite plans for a scheme of sewerage and sewage disposal. Mr. Charles Woodbridge, 38 High Street, Uxbridge

CONTRACTS OPEN.

ABERDEEN.—Oct. 13.—For erection of a monument at Duthie Park. Mr. John Rust, city architect, 224 Union Street, Aberdeen.

ABERDEENSHIRE.—Oct. 22.—For erection of distillery buildings and warehouse, excise officer's and manager's houses, offices, and workmen's cottages at Kennethmont Station. Mr. Charles C. Doig, architect, Elgin.

ALNWICK.—Oct. 19.—For additions to the training school in Northumberland Street. Mr. R. R. Temperley, clerk of works, Alnwick Castle.

ASTON-CUM-AUGHTON.—For erection of closet accommodation at the Swallownest Board Schools. Mr. W. Dust, 40 Bank Street, Sheffield.

BARNSELY.—For building eleven houses. Mr. William McCoy, Wellington Street, Barnsley.

BARNSELY.—Oct. 12.—For erection of four houses and butcher's shop at Hoyland Common. Mr. George Moxon, architect, Central Chambers, Church Street, Barnsley.

BATLEY.—Oct. 12.—For erection of a detached house in Deighton Lane. Messrs. C. H. Marriott & Son, architects, West Park Street, Dewsbury.

BELFAST.—Oct. 21.—For erection of new city hall. Messrs. E. Thomas & Son, architects, 7 Queen Anne's Gate, Westminster.

VARIETIES.

THE Victoria Hall, Ancoats, erected by the Manchester and Salford Mission, at a cost of about 9,000 $\frac{1}{2}$., is now open.

MR. ALFRED AUSTIN, poet laureate, has been asked to open the New Science and Art School at Ashford on October 13, and has promised to do so.

A UNITARIAN chapel for Leigh, Lancashire, which has seating accommodation for 250 persons and has cost altogether about 3,000 $\frac{1}{2}$., was formally opened on Saturday, the 2nd inst.

LESMAHAGON parish church, Lanarkshire (which was one of the most important in Scotland in pre-Reformation times) is being reconstructed.

THE public hall erected to commemorate Her Majesty's Diamond Jubilee at Sutton Scotney, near Andover, has been formally opened.

ST. MARY'S Hospital, Paddington, which has been closed for two months for extensive repairs, has now been reopened for the reception of in-patients.

A GREAT fire occurred recently in Manilla by which the Philippine Islands library and museum and other public buildings were destroyed.

THE lady chapel of Gloucester Cathedral, which has been closed for nearly a quarter of a century, has been reopened for public worship, after having undergone extensive restoration.

THE new technical school erected by the Handsworth District Council in Gold's Hill Road is now open. The building, which has been designed by Mr. William Henman, F.R.I.B.A., has cost over 10,000 $\frac{1}{2}$., exclusive of the site.

THE new Grove Road Board school, Harrogate, was opened on Thursday, the 30th ult. This is the second Board school opened in Harrogate during the present year, and, including site, has been erected at a cost of 22,000 $\frac{1}{2}$..

THE new union offices, which have been erected at Leigh, Lancs, were opened on the 30th ult. The cost of the extensions, which comprise spacious offices, board-room, tramp-wards and laundry, is about 12,000 $\frac{1}{2}$..

SIR CHARLES SEELY, who offered 1,000 $\frac{1}{2}$.. conditionally towards the rebuilding of the chancel of Carisbrooke Church, as part of the Isle of Wight memorial to the late Prince Henry of Battenberg, has decided that, owing to continued opposition from the press, the scheme had better be abandoned. Princess Beatrice approves of the withdrawal of the scheme.

147 STRAND, LONDON. W.C.

A PORTION of an old Roman bath has been unearthed at Dover during excavations carried out in connection with the restoration of the tower of St. Mary's Church. A system of Roman baths is stated to have extended from this structure to the market square.

THE Wesleyan church, Higher Broughton, has been reopened, after being closed for seven weeks. During this period the church has been thoroughly renovated, and is now fitted with the electric light. The cost of alterations and improvements has been about 800*l*.

THE Bath City Council have unanimously decided to confer the freedom of the city on the Duke of Cambridge on the occasion of his forthcoming visit to open the new pump-room and lay the foundation-stone of the Victoria Art Gallery. This is the first time the freedom of Bath will have been conferred.

THE trustees of the Maryport Wesleyan chapel have accepted an offer from Messrs. J. & B. Williamson, two members of the congregation, to provide a new organ, renovate the chapel, enlarge the Sunday school and build a ladies' parlour. The renovation scheme includes the insertion of new windows, one of which is to be of stained-glass.

AT about half-past five on Saturday morning, the 2nd inst., Waltham Abbey and neighbourhood were awakened by a terrific rumble. It was found that an explosion had occurred at No. 5 Mill, Millhead. It appears that the mill was utilised for the purpose of mixing a special kind of powder, prepared principally for rockets. The mills in which the powder is being worked up hold rollers of Welsh granite weighing close upon 5 tons each. The mills were not at work, but a gang of men were just about to start in the factory when the explosion took place. The danger inspector, who was some considerable distance away from the scene of the explosion, had a narrow escape. He was blown off his feet by the force of the concussion, and a portion of one of the millstones weighing over a ton pitched close to where he had been standing. Fortunately no one was injured, but the place was completely wrecked.

AT a meeting of the Manchester City Council held on the 6th inst., the scheme of the city surveyor for conveying the effluent from the Corporation Sewage Works, Davyhulme, to a point in the Mersey estuary, about 20 miles from the city of Manchester, was considered, and it was resolved by a majority of 68, viz. 71 for, 3 against, to apply to Parliament for powers to construct the proposed works.

ANOTHER addition to the rapidly increasing list of suburban theatres was made by the opening on Monday evening, the

4th inst., of the elegant Royal County Theatre at Kingston-on-Thames. Built on the site of, or rather a reconstruction of the Albany Hall, Kingston's latest public building will accommodate fourteen hundred persons. The dimensions of the auditorium are as follows:—Width, 46 feet; distance from curtain to front of dress circle, 35 feet 6 inches; to back of pit, 46 feet 6 inches; to front of gallery, 37 feet 6 inches; to back of gallery, 60 feet; from back of gallery to back of stage, 100 feet; and height from stalls floor to dome of ceiling, 37 feet. The decorations of the interior are in salmon, ivory and gold; electric light is used throughout; there is a luxurious lounge, and ample dressing-room accommodation. Mr. J. Charles Bourne and the late Mr. C. J. Phipps were the architects.

ST. JOHN'S parish church, Edinburgh, which has been closed for two months for renovation, is now reopened for worship. It has been entirely repainted, the walls in different shades of terra-cotta with appropriate ornamental bands and friezes, and the roof in dainty pink and cream colours. A feature has been made of the front of the gallery, which shows an embossed flowing floral ornament in burnished gold on a bronze background. The electric light has been introduced into the church, and for the lighting of the area there is a large and handsome electrolier suspended from the centre of the ceiling. New heating apparatus has been put in, the organ has been overhauled, while downstairs the halls have been rearranged, cleaned and decorated. The cost of the alterations and renovations is about 600*l*.

THE first effect of the construction of the Marine Drive round Castle Hill, Scarborough, was felt last week, when the tenants of the boat-building shops, coal warehouses, sail lofts, &c., on the harbour front received notice from the Corporation that they would have to vacate their premises six months after the expiration of tenancy, as the sites would be required for the southern approach to the Marine Drive. What the tenants will do, whose business calling is such as requires a water frontage, remains to be explained. The sands are out of the question, and removed from the harbour, there seems no other site suitable. With a large locally-owned fishing fleet and with seven or eight hundred visiting boats from distant ports, repairs to hulls, spars, sails and cordage are constantly needed. The difficulty is one which the Corporation, whilst in quest of promoting holiday attractions to Scarborough, has apparently overlooked, and the practical work-a-day industry of the port is in serious danger.

THE Cardiff new reservoir in Breconshire was opened by the Cardiff Corporation on the 30th ult. The cost of the reservoir was 198,000*l*. It has a capacity of 335,000,000 gallons. The additional daily yield for Cardiff will be 3,000,000 gallons. The reservoir occupied about four and a half years in construction, and the cost will be about 200,000*l*.

NEW LAMPS FOR OLD.

THE most recent development of the now well-known and universally approved incandescent mantle for illuminating purposes is its application to mineral oil lamps, whereby all the advantages which are admittedly gained by users of the incandescent gas-burner may be derived by those who prefer or are constrained, *faute de mieux*, to be content with lamps, with an important one in addition, which is that, owing to the generation of much less heat, the danger of explosion is to a large degree minimised.

The "Era" petroleum incandescent burner, the exclusive patent rights for which have been secured for Great Britain by the Incandescent Gas Light Company, is calculated to fulfil in all respects the necessary conditions of success as an incandescent oil lamp. The burner in appearance is very similar to the ordinary duplex burner, with the exception that it has a circular instead of a double horizontal wick. It is evident that special attention has been paid to producing a strong, well-made, well-finished burner of the best quality.

The burner is constructed with a lifter which enables the wick to be lighted without removing the chimney and mantle. There is also a patent and very clever contrivance for lifting and lowering the wick. The method of lighting the lamp is as follows:—

Having fixed the mantle and chimney on the burner the gallery carrying them is lifted by turning the screw of the lifter; this exposes the wick, which is lighted in the ordinary manner, and gives the ordinary flame of an oil lamp. The lifter is then lowered and the flame slowly turned up, and from being an illuminant flame as it is turned it becomes a perfect atmospheric flame, causing the mantle to become brilliantly incandescent. The full amount of incandescence is not obtained until the lamp has been lighted for about three minutes, and is thoroughly warmed.

The advantages of the "Welsbach" incandescent system when applied to oil lamps are as follows:—In the first place, a brilliant light of about fifty candle power is obtained, and at the same time only about a third of the amount of oil is used which would be consumed in an ordinary oil lamp giving the same light. The heat produced is considerably less than that of any other oil lamp giving the same candle power. There is perfect simplicity in dealing with it, and aided by the very explicit instructions which are sent out with each lamp, no one can experience the slightest difficulty.

The most important feature of the burner is that it can be fixed to any duplex lamp, the old burner merely being unscrewed and the "Era" burner being screwed on in its place. In one respect it has a great advantage over the incandescent gas light burner, and that is, in the event of the mantle being broken, and another not being readily obtainable, it is only necessary to replace the cap of the burner by a spare cap which is supplied with each burner, and by so doing the flame of an ordinary lamp is obtained.

TRADE NOTES.

THE Clergy Daughters' Schools, Casterton, Kirkby Lonsdale, are being warmed and ventilated by means of Shorland's patent Manchester grates.

IN consequence of their premises at 15 Parliament Street, Westminster (where the firm was established in 1777), being about to be pulled down by the Government, Messrs. Geo. Trollope & Sons have taken temporary offices at No. 5 Victoria Street, Westminster. There is no alteration as regards their other offices, No. 7 Hobart Place, Eaton Square; West Halkin Street, Belgrave Square; and 77 Grosvenor Road.

THE continued spread of the typhoid outbreak at Maidstone, and the severe strictures by the Press on those responsible, remind us of a most admirable system introduced by a well-known firm of water engineers (Messrs. Merryweather), by which the water sources of country houses may be periodically inspected and an analysis taken of water used for drinking. By the adoption of this system, anything in the water detrimental to health might be discovered before any serious harm resulted.

MESSRS. ROBT. NEILL & SONS of Manchester have had their tender of 253,000*l.* accepted for the building of the new Lancashire Lunatic Asylum, which is to be erected at Warwick, near Warrington. The electric lighting will cost a further sum of 14,000*l.*

MESSRS. EDISON & SWAN are sending out a neatly got-up "Souvenir of the Imperial Victorian Exhibition," which, besides containing particulars photographically illustrated of their exhibits, gives a historical review of the introduction of the electric light in England.

WE recently had an opportunity of inspecting some specimen slabs of marbles and labradores from the quarries of the Ankerske Marble Works in Norway. These offer a wide diversity of colourings, among them being the following:—

Pure white for statuary; white with blue-grey veins and streaks; white with blue-grey bands; rose spotted breccia in various shades; yellow red white spotted breccia; white with dark veins, streaks and spots in rich patterns; dark blue, grey and white streaked; light blue, grey and white streaked; light greenish, blue, grey and white streaked; yellow white with red, violet and greenish veins; red, partly with grey and greenish bands; grey, partly a little streaked; black with small spots of fossil shells; black with white veins and streaks, and dark green serpentine. These marbles, which are dolomite, possess great hardness and density, and it is claimed for them that they are practically impervious to the pernicious chemical influences of the London atmosphere, in which the white dolomite marble from Fauske has preserved its fine white colour for several years, while Italian calcareous marble after a short period, even in comparatively clean atmosphere, gets darker and takes a grey and plain-looking exterior, caused by a sort of oxidation on the surface; while as to strength several trials as to the resistance against pressure and absorption of water of this marble were made in 1885 at Königliche Prüfungs-Station für Baumaterialie, Berlin. The trials were made with cubes 6 centimetres on each side, of which some of them first were put into water for twelve hours, and after this they were exposed to a temperature of $\div 6$ till 9 deg. Celsius, and the result proved eminently satisfactory. Another important advantage offered by these marbles is the large sizes in which they can be quarried, as, for instance, columns some 30 feet in length and of proportionate diameter could easily be got. The stones can be supplied in any quantity, and in either rough or finished condition.

BUILDING AND BUILDERS.

THE foundation-stones of new technical schools and free library were laid at Middlewich on Saturday last. The building is admirably designed, and is founded in commemoration of the Diamond Jubilee.

THE young Earl of Dumfries, elder son of the Marquis of Bute, accompanied by his brother, Lord Ninian Crichton-Stuart, performed the ceremony of laying the foundation-stone of a new Roman Catholic church at Mountain Ash. Lord Dumfries, who is sixteen years of age, was presented with a chased silver trowel and an ebony mallet as a memento of the occasion. The stone was blessed by the Bishop of Newport.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

THE ceremony of laying the corner-stone of a new chapel in connection with the convent of the Little Sisters of the Poor, Gilmore Place, Edinburgh, was performed on Thursday, the 30th ult. The building, which has already been commenced, is being erected by Messrs. Wm. Beattie & Sons from plans by Mr. James M. Monro, Glasgow. It is in the Romanesque style of architecture and is intended to accommodate about 250 persons. Besides the chapel proper, there will be behind the sanctuary a number of sacristies for the use of the sisterhood. The cost is expected to be about 3,000/.

THE foundation-stones of the Drill Hall, which is to be Chesterfield's permanent memento of the record reign, were laid under auspicious circumstances on Wednesday last. The building is to cost about 2,500/. Mr. W. Cecil Jackson is the architect, and in his design he has kept in view the purpose for which the hall is required. In style the structure will be Early Renaissance, and the hall measures 150 feet by 55 feet. It will be built of red brick, relieved by stone dressings and buttresses, and will have an imposing entrance facing Ashgate Road, near the bottom of Fairfield Road. The site has been given by the Corporation. Under the hall will be a large armoury, and an adjutant's-room, sergeants'-room and officers'-room will also be provided.

THE foundation-stone of the church of All Saints, Stechford, was laid on Monday, the 4th inst. The new church will take the place of the iron building in which the services have been carried on for some time, and which occupies a portion of the ground in Albert Road set apart for the purpose. It will consist of a nave, north and south aisles, baptistery, chancel, chancel aisle and vestry. The nave, including the baptistery, will be 87 feet long and 20 feet 2 inches wide, the aisles 10 feet wide and the chancel 30 feet by 19 feet. The total length of the church will be 117 feet 3 inches, and the width across the body of the church 44 feet 8 inches. The church when completed will accommodate 504 adults. The eastern portion of the church and three bays of the nave are to be erected first. The west end, with tower and spire, will be erected as soon as funds will permit. The exterior will be of brick and terra-cotta dressings, the interior of brick with Bath stone dressings, the style being Gothic of the Decorated period. Messrs. Collins & Godfrey, of Tewkesbury, are the contractors, and Mr. J. A. Chatwin, of Birmingham, is the architect.

ON the 2nd inst. the foundation-stone of St. Margaret's Church, Polmadie, was laid. This is the third church which

is being erected in connection with the scheme of further church extension initiated by the kirk-session of the parish of Govan. The building when completed will comprise a church to hold about 800 persons, halls to accommodate 300 and a manse. It is part of the scheme that the model plan adopted by the architect, Mr. Macgregor Chalmers, should be retained, so far as the exigencies of the different sites will permit. There will be a nave, with one large side aisle, in which the only gallery is placed; a deep chancel for the communion table and the choir, a transeptal chapel and an organ chamber. The whole interior is to be finished in dressed stone. The roofs are to be of open timber, and the congregation will be seated on chairs. Individual character will be given to each church by modifying the designs. In St. Margaret's the work will be carried out in an early, undecorated type of Norman work.

ELECTRIC NOTES.

FOLKESTONE is to be lighted by electricity as soon [as arrangements have been made with Earl Radnor for a site for the works. It is anticipated that the installation will be completed by spring.

As a result of the investigations undertaken in many of the principal towns by the special committee appointed by the Fulham Vestry to consider the best means of disposing of the dust and refuse of the parish, it has been determined to follow the plan adopted in Shoreditch and to establish a similar system of dust destructors and electric-light producers as was recently inaugurated by Lord Kelvin. The scheme utilised the heat produced by the combustion of the refuse for the generation of steam to drive the electric dynamos, and the success which has attended the Shoreditch experiment is said to be complete. At first provision is only to be made in Fulham for the destruction of one-half of the parish refuse. It is probable that the same method will be adopted both at Brentford and in Newington.

A REPORT has been presented to the St. Pancras Vestry showing a gross profit of 5,063/ 2s. 8d. earned by the Regent's Park station electrical installation during the half-year ending June 30 last, and a gross profit in respect of the King's Road station, subsequently opened, of 293/ 15s. 11d. The electricity committee regarded this as eminently satisfactory. In the case of the Regent's Park station it represented an increase of more

than 15 per cent. per annum over the half-year ending December 31 last, whilst in the case of the King's Road station a gross profit of 293*l.* 15*s.* 11*d.* on the six months was earned, as against a loss of 847*l.* 2*s.* on last year's working. The net result of the six months' trading ending June 30 last, after meeting all payments of instalments of loans and interest, was a profit on the Regent's Park station of 2,040*l.* 2*s.* 9*d.*, and a loss on King's Road station of 739*l.* 15*s.* 9*d.*, to which was added the deficit of 800*l.* 12*s.* 7*d.* at December last, leaving a profit balance carried forward on account of both stations of 499*l.* 14*s.* 5*d.*

ABOUT a year ago the Eccles Corporation sought borrowing powers for carrying out an electric-lighting scheme for the borough at a cost of 18,000*l.*, but at the Local Government inquiry the opposition was so strenuous that the sanction was not given. The provisional order of the Board of Trade was, however, extended twelve months. In the meantime a modified scheme was prepared, and the Town Council thereupon sought borrowing powers for 11,408*l.* As the result of the inquiry a short time ago information was received by the town clerk that the amount asked for would be sanctioned, the period of repayment being fixed at twenty-five years. It is expected that the scheme will be carried out by the Edison-Swan Company of Manchester. The main thoroughfare will be lighted up by the Brighton system.

AT the meeting of the City Commission of Sewers on Tuesday a report was presented by the streets committee relative to the notice from the Postmaster-General requiring the consent of the Commission to laying underground telegraphs in the City, intimating that failing such consent a "difference" would be deemed to have arisen between the Commission and the Postmaster-General, and stating that the Postmaster-General would apply to the tribunal having jurisdiction to hear the difference, and recommending that the Commission adhere to their previous decision in the matter, that while they did not object to the Post Office authorities opening the streets for laying underground telegraph wires for their own purposes, they objected to give their sanction to wires being laid down for the use of the National Telephone Company unless the company were prepared to provide an improved service at a reduced cost. The report was agreed to, and the Commission also decided to refuse the application of the National Telephone Company for permission to lay eight pipes from St. Andrew's Street, Holborn Circus, straight down Holborn to the City

boundary because the company was not prepared to make any concessions for the easement in question.

AT a meeting of the lighting committee of the Liverpool Corporation held at the Municipal Offices, Dale Street, Mr. C. Petrie presiding, the committee was informed that owing to the great quantity of applications for the supply of electricity extensions of the main into Chatham Street, Bedford Street, Falkner Street, Scotland Road, Aigburth Drive, Bentley Road and Whitechapel were necessary. These extensions were sanctioned by the committee, and will be proceeded with at once. The engineer reported upon the necessity also of proceeding with the trunk main to Lord Street and Whitechapel, consequent upon the anticipated demands for electric light having been largely exceeded. This work, which will cost about 2,500*l.*, it was intended to defer until next year, but as a result of the engineer's statement the committee authorised it to be gone on with at once. The superintendent of lighting presented a report relative to incandescent lighting in the city, and with a view to arranging for the better illumination of the streets in the recently added areas, recommended the extension of the present system, at an outlay of about 1,500*l.* The committee approved of the report, and decided to apply to the Council for a supplementary estimate to enable them to carry out the recommendation contained in the report.

NATIONAL REGISTRATION OF PLUMBERS.

AT the last meeting of the Birmingham District Council a report was submitted by the secretary of the work done in connection with the local registration of plumbers from the inception of the movement to the present time, and also the accounts, which were approved and adopted. Owing to many alterations in the original constitution of the council, by reason of death and resignations, it is proposed to refill the vacancies by the appointment of other friends of the movement. The work has been much delayed publicly from various causes, chiefly by the proposed Registration Bill, which has for several sessions been before the House of Commons, but which, through pressure of other legislation and opposition from unexpected quarters, has not yet been successful in passing, although during the session this year it met with greater success than before. Other routine work was also performed, and it was arranged to hold a public meeting at an early date.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

WOODEN ENCLOSURES.

ON October 1 Mr. Mead gave his decision at the North London Police Court in the case of A. Payne, district surveyor of East Hackney (South) and North Bow v. William Slater. Mr. Payne, in his evidence, said that defendant had made a washhouse addition at the back of 21 Lauriston Road, Hackney, converting the wall of adjoining house into a party wall without carrying out the rules as to party walls with regard to it; he had erected an enclosure at the back of the yard of wood with door and two windows instead of a brick wall; he had also erected a copper and irregular chimney; he then allowed some time to elapse and converted the whole into a building by putting a roof on. Defendant had carried out an addition at the same premises before in 1893, and stated that the things complained of had been done a long time before, and tried to mix up the case with the work done in 1893. The magistrate took some time to consider his decision, and gave judgment on October 1. He stated that he had come to the conclusion that the work done by the defendant came within the Act, and must be done according to the rules. He inflicted a nominal fine of 10s. and 12s. costs, and intimated that if the work was not amended to the satisfaction of the district surveyor the defendant would be liable to further penalties.

SANITARY INSPECTORS' ASSOCIATION.

THE annual meeting of the Sanitary Inspectors' Association was held on Saturday evening at Carpenters' Hall. Mr. W. W. West (Walthamstow) presided. The annual report showed that there were 583 members on the books. The branches had continued to be active centres of influence among the inspectors in their several districts, while the Institute of Certificated Sanitary Inspectors had thrown in their lot with the Association. As the Superannuation Bill intended to help the members in conjunction with other public servants had not met with the success expected, the council had decided to take the necessary steps to have the measure framed by the Association reintroduced, in the belief that the claims of the Association would be conceded by Parliament. In this connection the council expressed their pleasure in acknowledging the continuance of the policy of the Local Government Board in urging local authorities to appoint their inspectors permanently. Owing to the death during the year of the president, Sir B. W. Richardson,

Sir John Hutton had been elected to fill the vacancy. The invitation to hold the provincial meeting next year at Newcastle has been accepted. On the motion of Mr. Dee, seconded by Mr. Gardner (Worthing), the report was adopted. The financial statement indicated that there was a small balance in hand. Mr. T. G. Dee (Westminster) then took the chair as the elected chairman of the council for the coming year. In referring to the work of the press in giving publicity to matters of sanitation, the chairman made allusion to the Maidstone epidemic. He said he thought the case of that town only showed that where there was no Government analysis of the water-supply of a town the sanitary inspector should be empowered to see that water companies supplied a pure article. The question of the admission of lady members to the Association was adjourned.

ARTISANS' DWELLINGS FOR BRIGHTON.

In a special report to the Brighton Town Council the sanitary committee mention that, in response to the advertisement inviting competitive designs and estimates of the cost for the erection of dwellings for the working classes upon the land in Elm Grove and Lewes Road, designs and estimates have been sent in by nine candidates. The committee have arrived at the conclusion that none of the designs comply in every detail with the conditions of the competition and by-laws, and they do not consider that any of the designs fully meet the requirements of the Corporation. They think, however, that the design under the title of "Sanitas" is an excellent attempt to comply with the conditions, and they therefore recommend that the sum of 75%, the first premium, be awarded to the author of that design, subject to his showing to the satisfaction of the Council that the works can be carried out for the sums specified in the estimate. With regard to the remaining designs, the committee consider that none of them comply with the conditions or meet the requirements of the Corporation in a sufficient measure to justify them in awarding the second premium. They think, however, that certain of these designs show that a great amount of thought, time and care have been expended in their preparation, and they recommend that the second premium of 25% be equally divided between the authors of the designs entitled "Pax," "O. K." and "Minimum and Maximum," which appear to be of about equal merit. "Sanitas" it should be explained, allows for 168 six-roomed houses in Elm Grove (three bedrooms), and estimates the cost

at 174*l.* 13*s.* 2*d.* per house, 69 houses for the Lewes Road, five rooms (three bedrooms), and the cost 176*l.* per house. In the "remarks" accompanying the particulars it is pointed out that the pavement, curb and channel in Elm Grove is not included, and in Elm Grove the sewer is omitted. "Pax's" figures for 143 houses in Elm Grove and 66 in Lewes Road are 176*l.* 15*s.* 7*d.* and 175*l.* 7*s.* 4*d.* respectively for each dwelling, and he includes the sewer in the former thoroughfare; while "O. K.'s" estimate for 136 houses in Elm Grove is 176*l.* per house, "but no estimate for roads, &c., having been given, it is impossible to ascertain what has been included." "Minimum and Maximum" estimates for 145 five-roomed houses (three bedrooms) in Elm Grove, and allows 174*l.* 19*s.* 7*d.* per house, but does not include pavement, curb and channel, although the sewer is included. The highest amount per house is 185*l.* 7*s.* 11*d.* and the lowest 173*l.* 10*s.* 7*d.*

SEWAGE DISPOSAL, MANCHESTER.

THE plans of the proposed works for the conveyance of the sewage effluent from the Davyhulme works to the estuary of the Mersey were submitted lately to Sir Benjamin Baker and Mr. W. Santo Crimp. The following replies have been received:—

"To the Chairman of the Rivers Committee of the Manchester Corporation.

"Sir,—In a letter to the town clerk, dated August 28, 1896, I stated my opinion that the carrying of the effluent by an outfall sewer into the tidal waters of the river Mersey, near to Randles sluices, would afford the best solution of the Manchester sewage problem, but that before expressing my views of the details of the surveyor's plans, I required to give further consideration to the matter.

"During the past twelve months I have had an opportunity of giving the question more detailed consideration.

"At a meeting at my office on October 27, 1896, when yourself, Councillor Worthington, the city surveyor and Mr. Mansergh were present, the question of the possible influence of the proposed outfall sewer on the interests of the Ship Canal Company, the borough of Warrington and others was fully discussed, and at the same time local information of various kinds was communicated to me. More recently I have been furnished with additional data, enabling me to consider such details as the necessary size and cost of the outfall sewers and to make independent calculations of my own on the subject.

"As a result of these further investigations, I have found no

reason to modify the general conclusions expressed by me in the letter already referred to. I have to add that I approve of the proposal to put a second outlet into the Mersey just below Walton Lock. Indeed, as a matter of fact, I suggested myself at the meeting on October 27, 1896, that an outlet at that point, coupled with the original one at Randles sluices, would apparently obviate all difficulty as regards the alleged conflicting interests of the Ship Canal Company and the borough of Warrington, since the sluices at the respective outlets could be worked according to the varying conditions of flood discharge and of the river generally, so as to be beneficial rather than detrimental to the parties interested.

"The size of the outfall sewer proposed by the city surveyor is, according to my calculations, amply sufficient for the 70,000,000 gallons per day, and the city surveyor's estimate of 258,000*l.* is also sufficient, assuming the amount put down for easements is correct.—I am, your obedient servant,

"September 30." (Signed) "BENJAMIN BAKER.

Mr. W. Santo Crimp writes on the same date:—

"Manchester Drainage.

"Dear Sir,—In reply to your inquiry as to the relatively small cost of the Barking filters when compared with those proposed to be constructed at Manchester, I beg to say that in the construction of the Barking experimental filter—which filter was made by myself—no excavation was necessary, and the greater part of the area of the filter, was constructed against existing embankments. Thus no expensive structural works were necessary. Means also existed for carrying off the effluent water, which was admitted to the filter by means of wooden shoots of a temporary character. I may also say that the material of which the filter is composed was obtained from the gasworks adjoining the site of the works at the extremely small cost of 1*s.* 3*d.* per ton, delivered alongside. I am quite sure you would not get the enormous quantity of breeze or clinker required for your filters at anything like this price, and, as you are aware, the levels of the land necessitate a large amount of excavation and also expensive enclosing works.

"I certainly would not recommend you to reduce the estimates of the cost of these filters. You are no doubt aware that the cost of proprietary filters amounts to upwards of 10,000*l.* per acre, and my experience of Barking showed that these filters were not more effective than those made of breeze.

"With regard to the proposed effluent culvert, I was struck with the recent remarks in the public press. The fact appears

SOHO COWL AND VENTILATOR

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

The Smethwick Ventilating Co.,
DESPATCH WORKS, SMETHWICK,
Near BIRMINGHAM.

to have been overlooked that the canal water does not contain those natural agencies which are necessary for the destruction of the organic matter, which must remain in a chemical effluent, no matter what process is adopted for the clarification of the sewage. The conditions prevailing in the estuary are entirely different, as at high-water the river Mersey at that point is practically sea, which contains all the elements for the final purification of the sewage. The proposed outlet is, in short, more satisfactorily placed than the outlets discharging the London effluent into the Thames, being so much nearer the mouth of the river.

"I need hardly point out to you that there is a finality about this scheme that neither of the other suggested alternatives possesses, and, to adopt the wording of your own report of September 1, 1896, 'by the adoption of the scheme the sewage problem would be solved once for all,' and I would add that it would be solved at the least possible cost to the ratepayers of Manchester, whilst the works contemplated would be of a permanent character.—Yours very truly,

(Signed) "W. SANTO CRIMP, M.Inst.C.E.

"T. de Courcy Meade, Esq., Manchester."

It was decided on Wednesday, the 6th inst., that an application be made to Parliament to obtain an Act authorising the construction of the culvert by the Corporation.

LEEDS ASSOCIATION OF ENGINEERS.

THE first meeting of the session was held at the rooms of the Association, 5 Park Lane, on September 30, when the president (Mr. William Sheldon) delivered an address. Reviewing the past year, he said that a noteworthy feature had been the formation of large numbers of companies and syndicates with enormous capitals, but it was to be doubted whether these gigantic speculations represented sound commercial trading. With regard to technical education in relation to commercial success, he doubted whether, if it were freely adopted in this country, we could defy all competitors. The success of our goods in the markets of the world depended not so much on the cost of production as on the art of selling. If we allowed our competitors to establish the first footing in Japan, it would be our own fault. Civil engineering had not recently made such strides in this country as it had done abroad, perhaps owing to want of scope. Our railways had, however, been considerably extended. In mechanical engineering

the main interest had centred in the Belleville boiler and the motor car—in the former because of the great scale on which the Admiralty had tried it with success, in the latter because of its public importance. Unfortunately the general public expected the motor car to do impossibilities, and it had as yet no existence in the commercial sense. The principal event in shipbuilding had been the Bazin roller boat, certainly a novelty and possibly a success. The inventor fully expected the boat, which was having her engines put in at Rouen, to travel at a speed which would entirely revolutionise our Transatlantic records. In the agricultural line much had been heard of the new steam digger, but its use was at present confined to a few places. The chief foreign invention was the rotary plough, exhibited at Buda-Pesth and Hamburg, which was in reality a very old English invention revived. The chief field for electrical engineering in the United Kingdom was electric lighting, which was now so fully recognised as a promising investment that public bodies were becoming unwilling to allow private companies to acquire powers of supply. There was an increasing development of electricity for tramways. The overhead direct current system, with a trolley, had been installed in various towns, notably in Leeds, Bristol, Hartlepool and Coventry; whilst in Dublin the three-phase current with overhead wires appeared to give satisfaction. Electrical driving for large works was coming daily more to the front. Experience, taken as a whole, showed that for plants using not less than 100 horse-power electrical transmission was much the most economical. Its adoption commonly resulted in a large reduction of cost, and if the change was carried out with caution and judgment it was invariably satisfactory. With regard to Leeds, in recent years we had seen a spread of industries unequalled at any other time, so that employers had found some difficulty in securing workmen, and wages had proportionately increased. Mr. Sheldon concluded by expressing a hope that in the future, as in the past, we should hold our own as a nation, steadily progressing year by year, not wavering because we hear of this, that, or the other country achieving the highest success in any particular line of trade, but trying ourselves to excel in all, especially in mechanical engineering.

The vice-president (Mr. J. A. Tempest), Messrs. A. Towler, A. Atkinson, W. H. Drake, R. Lupton, R. W. Crabtree, A. M. Casperson and C. H. Holgate also addressed the meeting, after which a vote of thanks was accorded to the President on the motion of Mr. T. Craister, seconded by Mr. Jas. Bowers.

TRAMWAYS IN ROME.

THE application of electricity to tramways in Rome has of late been largely developed, and the results have proved satisfactory. The first electric line was opened for public use in 1895, under a concession which secures to the already existing tramway-omnibus company the extensive privilege of working that line for twenty-five years, viz. up to the end of August, 1920. Various other important lines subsequently adopted electricity, in respect of which the same privilege alluded to above was conferred upon the company. The system of overhead wires has been adopted up to the present, but the question is open whether the same system is to be applied to other important lines still worked by horses. It does not seem that overhead wires meet with much favour at the hands of the municipality, because they are not pleasing to the eye, so that it will have to be decided what other system is to be adopted, taking into account local requirements, especially connected with winding roads and their altimetric conditions. The electric energy is furnished by the gas company, which owns the large electric works of Tivoli, with hydraulic motors.

The financial success of the tramway-omnibus company, embracing electric and horse trams and omnibus, is not such as one would expect, judging from the large crowds of passengers on its lines, chiefly on those worked by electricity. It is probable, however, that when electricity will have been applied to all the lines and the company will be more settled, the advantages of the new system may have some bearing on the financial results of the undertaking.

ELECTRIC LIGHTING IN LANCASHIRE.

THE assertion that electricity is likely to become the light of the future is receiving proof of its near realisation almost every day. The thoroughfares in the centre of Liverpool are now brilliantly lit up by the electric light, and the improved lighting power and other advantages are appreciated by the people. The electric power for lighting purposes is also being carried into the outer districts near Liverpool. For the borough of Bootle a provisional order has been obtained, and it is anticipated that the streets of that rising centre of industry will soon be lit up by this illuminant. The popular and increasing neighbourhoods of Seaforth, Waterloo and Crosby

have, with remarkable enterprise and energy, says the *Liverpool Courier*, adopted the system of electric lighting, which will be brought into operation in the course of a day or so. The adoption of this improvement is taken by the inhabitants as an evidence of the energy and watchfulness which the different public functionaries of those districts exercise over the well-being of those over whom they have control.

With commendable forethought and anxiety for the benefit of the populace, and with an idea of obviating existing difficulties which do frequently occur in many households and institutions as regards a better lighting system, the whole of the members of the Crosby District Council over twelve months ago formed themselves into a committee to take into consideration means for adopting the electric-lighting system throughout the neighbourhood. The Council were favourably disposed to the undertaking being immediately taken in hand. It was mainly through the advances made by the Liverpool District Lighting Company to the Crosby District Council that a provisional order, under the Electric-lighting Act of 1896, was applied for to the Board of Trade and granted. The company immediately set about laying extensive mains which will distribute the electric current through Great Crosby, Blundellsands, Waterloo and Seaforth. The streets and roads which will come within the boundary for the reception of the electric light are Serpentine North, Serpentine, Serpentine South, Burbe Bank Road, Blundellsands Road West and Warren Road. Trunk lines have been laid along Blundellsands Road West, Bridge Road, Mersey View, Oxford Road, Mount Pleasant and St. John Street to the generating station, Waterloo. From the station mains will be laid along Great George Road with distributing mains along Waterloo Road, Alexandra Road, Victoria Road and Brunswick Parade. A main will extend along Crosby Road South to the point where it joins Seaforth Road. This latter portion of the undertaking will not be entirely completed for nearly two years yet. The line of electric current is shortly to be laid on to Waterloo Park, and 1,000 16 candle-power lights are at present waiting connection. The company's area of supply, covered by the above provisional order, is 6 miles long. In January 1888, the number of 16 candle-power incandescent lamps supplied by the company was 997, and at the present time the supply is equivalent to over 14,000 16 candle-power lamps. The system of supply that will be used is low tension, direct current, at an E.M.F. of 220. The plant at present fixed is capable of supplying 1,000 lamps at one time, but the buildings are large enough for plant for about

PRICE LISTS and FULL PARTICULARS on APPLICATION.

7,000 lamps, and land has been acquired for further extensions when required.

The generating station at Waterloo is a magnificent building, which possesses all the necessary electrical appliances. In one spacious room there are two batteries of 116 cells each, the latest pattern of the E.P.S. type, K33. Another room contains a similar plant. With regard to the machinery necessary for generating the electrical current, the boilers are of the Lancashire type, each being 28 feet long and 7 feet 6 inches in diameter, made of mild steel. The shell plates and end plates are $\frac{3}{4}$ inch thick, and the ends are strengthened by gusset stays. The boilers have two flues, 3 feet diameter, tapered to 2 feet 6 inches diameter at the back end, and made of mild steel plates, 7-16 inch thick, and each flue is fitted with six steel Galloway tubes. The working pressure is 110 lbs. to 120 lbs. per square inch. The water supply is taken into storage tanks from the town mains, and, where practicable, a duplicate service has been carried into the station from a second main. Two feed pumps (or a feed pump and injectors) are provided at the station, and a complete double system of feed pipes, with separate check valves on each boiler. The engines are Browett Lindley's central valve compound engines. The dynamos have magnets of the single inverted horseshoe type, with massive wrought-iron limbs. The armature shafts are coupled directly on to the crank shafts of the engines. The dynamos are wound to give an output of 150 amperes and an E.M.F. of from 110 to 290 volts, and are made by Messrs. W. & S. Robinson. The maximum safe rate of discharge of the cells is 150 amperes, and the storage capacity about 500 ampere hours at ordinary rates of discharge. All the distributing mains of the Liverpool Electric Supply Company are laid underground, and have been manufactured and laid by Callender's Cable and Construction Company, Limited, under the supervision of Mr. F. A. Pocklington, A.I.E.E., district engineer. The mains are laid in cast-iron troughs, $\frac{1}{4}$ inch thick and about 6 feet long, with socket joints. When the troughs are placed in position, about $\frac{1}{4}$ inch of refined bitumen, in a molten state, is run in, and, before setting, spacing bridges of wood are placed in it, about 18 inches apart. These bridges support the cables, and hold them in place, clear of the sides and bottom of the trough, and of each other. Bitumen is then run in, so as to entirely cover the cables and fill up the iron troughs to within $\frac{1}{8}$ inch of the top. The troughs are then finished by a covering of Portland cement concrete, about 1 inch thick. The service lines from the distributing mains to the consumers' premises are made of 7,

No. 14, wires, insulated. The connections of the various lengths of main to each other, and of the feeders to the distributors, are made by sweating copper lug-pieces on to the ends of the cables and by bolting copper connecting bars to the lugs. The distributing mains are joined in a similar way, the connecting-bar being fitted with terminal screws for the attachment of fusible tin strips, to which the service lines are attached. The main switchboard in the station is fitted with an ampere-meter and registering pressure indicator for each pair of feeders, all being of the Weston type. The Chamberlain-Hookham electric metre is used by the company, and consists of a simple electric motor, doing work against the retarding influence of Foucault currents, generated in a copper disc, rotating between the poles of a permanent magnet. The armature coils are built up on a copper brake disc, and the axis carries a worm upon which actuates a train of counting gear. The meter is calibrated so that the dial reads directly in Board of Trade units. The speed of rotation (subject to a small fractional error at small loads) is proportional to the current.

The current will be turned on for 200 receptacles, and it is expected that the number will rapidly increase when its benefits become more widely known. The company, whose offices are in Hackins Hey, have undertaken with singular success such large enterprises as the New Brighton Tower Grounds and the Eastham Grounds, which they have fitted up with the electric luminant. The whole of the extensive operations described are under the supervision of Mr. W. M. Horsfall, engineer to the company, who has the valuable advice of Mr. A. Bromley Holmes, consulting engineer to the company. The great majority of the residents express their satisfaction at the establishment of such extensive works in the neighbourhood, and assurances of assistance and taking up of the electric light have been given by most of the well-known residents in the district. The whole undertaking is estimated to cost 20,000*l.*, and the adoption of the system is stated to work out a remarkably economical figure.

STRAIGHTENING A CHURCH SPIRE.

A VERY skilful piece of work has just been executed by a firm of building contractors, Messrs. Hunter & Co., of Belfast, and the details of the feat performed by the firm, viz straightening *en bloc* of a church spire in the county Cork, may be of interest. For some time past, says the *Irish Times*, it had been noticed

that the spire of Trinity Church at Newmarket, county Cork, was considerably out of plumb, and latterly was leaning over to such an extent as to threaten to topple down on the body of the sacred edifice. Such a dangerous state of affairs could not be allowed to continue, and when Colonel and Lady Mary Aldworth returned from abroad they had steps taken immediately to have the matter remedied. This was no light undertaking, as to all appearance the work necessitated the complete taking down and rebuilding of the spire of the church. A skilful architect was engaged to inspect the church tower and spire, after which a contract was entered into with the well-known firm of Hunter & Co., Belfast, to promptly execute the work. Mr. Hunter and his staff of experienced steeplejacks attended specially from Belfast and set about the work of taking down and rebuilding the spire, but to the surprise of all, they found that the spire could not be taken down except it was done *en masse*, as the stones of which it is built were hermetically bound to each other with a combination of molten lead and sand, which rendered it absolutely impossible to separate one stone from another, the whole spire being, as it were, one solid block. On further and closer inspection it was found that the entire building was erected in a similar manner, no other mortar or binding substances of any kind being used save the sand and molten lead—a very curious and interesting circumstance to note. This most firm and enduring (but at the same time most expensive) form of construction was, it appears, much in use in Ireland over a century ago. A huge iron shaft runs through the top portion of the spire, on which the stones were slipped like rings and irrevocably rivetted with lead and sand. Under this extraordinary circumstance the idea of taking down the tower had to be abandoned, as being quite impracticable if not utterly impossible; but the desired end has been attained in as satisfactory a manner by an ingenious and clever method adopted by the contractor and his staff. The spire has been brought back to its original true perpendicular position, and now tapers beautifully straight, standing out very handsomely, the joints being beautifully pointed with mastic cement. This difficult and tedious piece of workmanship—the straightening of this spire—has been accomplished in a most successful and satisfactory manner, and reflects much credit on Mr. Hunter and his efficient staff of workmen, and Colonel and Lady Mary Aldworth, as well as the clergy and laity of the parish, have been very well pleased with the excellent way in which the spire of Trinity Church has been dealt with and put again into its proper position.

LEAD PIPES AND WATER SUPPLY.

A PAPER by Mr. C. H. Tattersall, medical officer of health for Oldham, on "The Action of Moorland Water on Lead," was read at the Leeds Congress. The action of moorland water, he said, on lead was a matter of the utmost importance to all authorities who obtained their water supply from the moors. Water from this source was, generally speaking, most satisfactory, being soft and remarkably free from contamination of any kind. Whatever contamination there might be was due to the presence of small quantities of organic matter dissolved by the water from the peat. Unfortunately, the presence of this small amount of organic matter causes an action on lead more or less active in proportion to its amount. This action has at times proved very destructive to various communities using this kind of water, one of the best-known examples being Sheffield, which suffered severely from plumbism between 1886 and 1889. In the autumn of 1895 there were a number of cases of lead-poisoning in Oldham. The water in each case was sampled, and found to contain lead in quantities varying from one-tenth to two-fifths of a grain per gallon. In one of the worst cases the old lead service pipes were removed and replaced by block tin-lined pipes. An examination of the old pipe revealed the presence of a copious brown deposit in flaky masses lining the pipe, and this was found to contain some salt of lead. The waters were more or less acid, although the amount of acidity in the worst sample was very slight when compared with many of the moorland water supplies in the West Riding of Yorkshire, notably Sheffield and Wakefield. The waters containing the greatest amount of albumenoid ammonia were the most acid, and this albumenoid ammonia was almost certainly derived from the peat. In Sheffield the difficulty had been met by allowing the water to flow over a substance known as "Paris white," from which it dissolved about two grains of chalk per gallon. Since this treatment had been inaugurated there had been no further trouble with regard to lead-poisoning from the water-supply. It had not been considered necessary by any of the Lancashire or Yorkshire authorities to filter this moorland water. Filtration in the ordinary method through filters of sand and gravel would prove effectual in preventing this action upon lead, in addition to improving the general appearance of the water, and acting as a safeguard against the possible introduction of pathogenic germs such as have been shown to occur at Rotherham and other places. The methods referred to have all reference to the treatment of the water

before its distribution to the town. Attempts had also been made to save the population from plumbism by substituting tin-lined lead pipes for the ordinary kind. This had been tried in Oldham, where, unfortunately, a large quantity of so-called tin-lined lead pipe had been used for domestic water service. This pipe was supposed to be washed with tin in a molten condition on its inner surface, and it had a whiter and brighter appearance than ordinary lead pipe. He had obtained a portion of this lead pipe, and experiments showed conclusively that it was absolutely valueless in preventing the action of the water on the lead, for there was no difference in any way between the action of the water on this pipe and the ordinary lead pipe. The best means of preventing lead-poisoning by moorland water were—(1) That the water be got off the peaty gathering-grounds as quick as possible; (2) that as much time as possible be given for subsidence and bleaching; (3) and most important, that the water be filtered through sand filters, or, failing this, be passed over "Paris white," as at Sheffield; and (4) that blocked tin-lined lead piping of good quality be used for water service pipes instead of ordinary lead pipes.

The president, Mr. W. Whitaker, F.R.S., contended that each case must be dealt with on its merits. While it was a good thing to expose moorland waters to the sun, a similar exposure deteriorated pure limestone water. Light should be kept away from all chalk water. They were addicted to using technical terms, which few understood. He failed to understand what Mr. Tattersall meant by "Paris white." He hoped some one would explain the term. He was surprised to find that tin-lined pipes did not act as a protection against lead-poisoning.

Mr. Richardson thought that a certain preventive of lead-poisoning was to pass the water over limestone. Water with only 1·2 degs. of hardness could in this way be easily increased to 2 or 2½ degs. It would be interesting to know whether water came into contact with sulphates of iron in crossing over a moor. The Paris white referred to he believed was a species of powdered lime.

The Rev. W. Carter asked what advantage was gained by substituting iron service-pipes for lead pipes in districts troubled with lead-poisoning? Whilst there was an objection to lead pipes in this district, there was an equally strong objection to iron pipes in some parts of Derbyshire.

Dr. Brown thought lead-poisoning was due almost entirely to dissolved oxygen. Occasionally he had found inorganic acid. A good deal of iron was obtained from millstone grits.

There was always more or less iron in water obtained from the moorlands. It was the simplest thing in the world to cure lead-poisoning. They could avoid all risk by not using lead pipes. He had substituted lead pipes at his home for iron pipes. The objections to the latter were, first, that iron pipes would not bend easily; secondly, that they were apt to become oxidised; and, thirdly, lead pipes gave way under the influence of frost, whilst iron ones invariably split. Persons using iron pipes must have stop-cocks fixed outside, and when a burst occurred turn off the water and send for the plumber.

Mr. Branson said the source of organic action was bacterial. Carbonate of soda, he believed, would render moorland water of 2 or 3 degs. of hardness free from the risk of causing lead-poisoning. Of course, in some waters it was not admissible to have more lime. Manufacturers objected to it. Carbonate of soda, however, was a ready agent in that case.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

21492. William Crowther, for "Improvements in and in the method of producing drainage or sewerage traps."

21547. Thomas Robert Hay, for "Improvements in or applicable to seats for water-closets, in part applicable to doors and other structures."

21568. William Henry Heywood, for "Improvements in the construction of bars for securing and carrying glass for roof and other glazing purposes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from ½th in. to 6 in. wide. Strands from 24 B.W.G. to ⅜th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

UNEQUALLED · FOR · **ALL** · DECORATIVE · PURPOSES.

Aspinall's

ENAMEL

For Inside and Outside Work.

READY FOR USE.

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

ASPINALL'S ENAMEL can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special
"DECORATOR'S" ENAMEL.

TRADE NOTES.

THE proprietors of Condy's Fluid notify us that they find it necessary to remove to more extensive premises at Condy's Fluid Works, 65 Goswell Road, London, E.C.

MESSRS. THOS. WALKER & Co., West Hartlepool, inform us that they have just now an exceptionally fine stock of seasoned woods, comprising Crown Austrian wainscot, Odessa oak planks and flooring, pitch pine, yellow pine, &c., strips for block flooring, wood-block flooring, dry, in oak, teak, pitch pine, and redwood.

MESSRS. EDGAR KEELING, TEALE & Co., of Clovelly Mansions, Gray's Inn Road, are sending cut a new illustrated list of their hammered ironwork, in which will be found an enormous variety of designs for electric light, gas, oil and candle fittings, finials, vanes, grilles and balustrades, shop signs and fittings, bell-pulls, fire implements and fittings, and ornamental items of all kinds. The firm make a specialty of art work for ecclesiastic and domestic purposes in silver, copper, brass and iron.

CATHEDRAL SERIES.—CANTERBURY: ST. GABRIEL'S CHAPEL CRYPT.—THE WEST DOOR.

ROTHERHITHE TOWN HALL.

MINTERNE CHURCH: MEMORIAL WESTERN GALLERY TO THE LATE LORD DIGBY.—FRONT AND END OF LORD DIGBY'S PEW.—NEW SEAT AND ENDS.

BUILDING AND BUILDERS.

PLANS have been prepared for a handsome Gothic church to be erected in Savile Town, Dewsbury, and dedicated to St. Mary. It will take the place of the present mission church.

A CHANCEL is to be added to the church of All Saints, Grays, Essex, as a memorial to the late Mr. James Theobald, M.P., for the Romford Division. Mr. Theobald, who was lord of the manor of Grays, gave the site and built the present church.

THE parish church of Clarkston, after being closed for a considerable time for internal alterations and repairs, was reopened for public worship on the 10th inst. It has been resealed and floored, and the lighting arrangements have been greatly improved.

A PAINTER has just met with a terrible death at Blackburn. He was being hoisted up outside the tower of St. Paul's Church in a swing seat in order to paint the woodwork at the top, when the rope broke, and he was precipitated from a great height to the flagged pavement below, sustaining terrible injuries, from which he died a few hours afterwards at the infirmary.

MESSRS. SPENCE'S new premises now being erected on the old site, which gained considerable notoriety through Mr. Maskelyne's Jubilee speculation, have been designed by Messrs. Banister Fletcher & Sons, and will be architecturally a very great improvement on the buildings which they replace. They will consist of a basement, ground floor and four upper floors. The front, which is Elizabethan in style, will be faced with Portland stone, and the ground floor will contain four large bay shop windows. Five Ionic columns, with consoles over, crowned with groups of statuary representing the main features of the Queen's Jubilee (the centre piece being a statue

of Her Majesty), ornament the front. The basement will contain the packing-room, country order-room, a buyers' order-room and large and well-ventilated lavatories. The show-room on the ground floor will be constructed without any division walls, and the first floor will also contain large showrooms. The counting-house and offices will be placed on the second floor, and the third floor will contain dining-rooms for the staff and for the partners, and serving-room from the kitchen. On the fourth floor will be situated the housekeeper's accommodation, a large kitchen and scullery, bedrooms, lavatory, bathroom and water-closets. The construction will be fireproof throughout, the floors and partitions being of steel and concrete. The different floors will be approached by a handsome circular staircase formed in teak. The windows will be fitted with large plate-glass, and the rain-water will be collected into massive leaden heads of old English design. The roofs will be covered with green Westmoreland slates in graduated courses, and the ridge finished with ornamental lead and copper work.

GENERAL SIR REDVERS BULLER laid on Tuesday the foundation-stone of the new church of Emmanuel, St. Thomas, Exeter. The parish of Emmanuel was some years ago divided from that of St. Thomas, of which Sir Redvers Buller is the patron, and he has given the site for the new church. The building is to cost 9,000*l.*, is to be erected from designs by Mr. H. Brakspear, A.R.I.B.A., will be in the style of the sixteenth-century Gothic, and will provide accommodation for 600 persons.

ELECTRIC NOTES.

AN electric clock has been erected on the south-east side of Piccadilly Circus. It is beautifully designed and can be seen at any time of the day or night at a great distance. The illumination is very effective, electric light being carried along the moving hands, with fixed stars at each figure. It is stated that when adjusted the clock should go for years without attention.

A SPECIAL meeting of the Llandudno council was held to receive the report of the electric-lighting and refuse disposal committee. Mr. T. W. Griffith (ex-chairman) presided. Mr. T. T. Marks, in moving the adoption of the minutes, with reference to the tenders, &c., and also a recommendation that the council sanction proceeding with the work at once, said that

the total cost of the scheme amounted to about 1,300*l.* less than the committee estimated. The committee hoped to fulfil their promise to have the town lighted with electricity by next spring. The plan for lighting the town was then submitted, and the minutes were confirmed.

THE report on the electric lighting and power, water supply, &c., prepared by Mr. F. J. Warden-Stevens for the Guardians of Poplar, has been printed and circulated. This report shows that a great saving can be effected in such instances by combining the plant for the various purposes, while it also points out that the waste heat can be utilised. The committee who have the matter in hand are considering the adoption of the combined scheme as recommended by Mr. Warden-Stevens.

WE note that the directors of the Hanover Electric Tramways have decided as to the merits of the accumulator and overhead trolley systems. The decision, which is in favour of accumulators, is one of great importance, as the directors have had considerable experience with both forms on their lines. The accumulators have been charged *en route* in the suburbs to run the cars through the centre of the city. The cost of maintenance for 1896 was 14*4d.* per car mile, including cost of renewals, and it was found that the cost of accumulator working came out at only .0026 of a penny per car mile more than that of the overhead trolley. Taking everything into consideration, it has been decided to work the whole system with accumulators as soon as the change can be carried out.

A NEW electric-lighting station at Bradford was formally opened on the 8th inst. The building is situate in Valley Road, and the plant and premises have cost close on 40,000*l.*, whilst the capacity of production is 12,000 eight candle-power lamps. The new machinery consists of two six hundred imperial horse-power engines, two six hundred electrical horse-power dynamos, feed pumps, two boilers, condensing plant, switchboards, &c., and all of the latest and most improved type. The dynamos have an output of 750 amperes at 500 volts when running at a speed of 300 revolutions per minute. The steam boilers are cylindrical and single ended, 9 feet 9 inches in main diameter by 10 feet 6 inches in length. The new switchboards consist of ten slate panels, 1 foot 6 inches by 6 feet 4 inches long by 1½ inches thick, and two slate panels 4 feet wide by 6 feet 4 inches long by 1½ inches thick. The volt-meter switchboard consists of three slate bases fitted together in a cast-iron frame, and is fitted with Lord Kelvin's

IMPORTANT TO ARCHITECTS

WM. WALLACE & CO. have special facilities for carrying out Architects'

Designs in the best manner at the lowest possible cost, and invite drawings and specifications for Estimates (free of charge).

electrostatic volt-meters. Mr. J. L. Morley, Bradford, has supplied the condensing plant, which includes air and circulating pumps. The new machinery has cost 10,325 $\frac{1}{2}$ l.

HAMMERSMITH is to be congratulated on the possession of a scheme of electric lighting at once efficient and economical. Under the supervision of Mr. A. H. Preece, a generating station has been erected in Fulham Palace Road, from which electricity is distributed under the high-pressure alternating current system, whereby the supply is generated at a pressure of 2,000 volts, and consumers are served from low-pressure mains of 110 volts from underground sub-stations. All told, there are four main circuits, arranged so as to meet the wants of the Broadway, King Street, Goldhawk Road and Uxbridge Road districts, and the "compulsory" area alone is a very extensive one. For the purpose of the street lighting arc lamps have been employed, each fixed 20 feet from the ground, and giving about 1,200 candle-power. On each post, however, there are two glow lamps of 32 candle-power. Between sunset and midnight the streets are lighted by the arc lamps, giving a light equal to 1,200 candle-power. After that hour the glow lamps are used. Private consumers, of whom there are forty, using an electrical equivalent of 4,000, are encouraged to adopt the new light by a scale of charges which at Brighton is said to have shown a saving on the price of gas when lamps are used for a certain number of hours. Sixpence a unit is charged for the first two hours, and fourpence a unit for succeeding hours, a unit of electricity being equal to the light of a gas-burner consuming 120 cubic feet of gas. The alternative scale is that of the Board of Trade—2 $\frac{1}{2}$ d. per unit, with a fixed charge of 1s. 3d. per quarter for every 8 candle-power lamp. The cost of the installation has been 40,000 $\frac{1}{2}$ l., and between 8,000 and 9,000 lamps must be in use before a profit can be made.

VARIETIES.

THE new church of St. Gabriel, Willesden Green, was consecrated on the 8th inst.

A NEW Board school has been erected in Kennington Road for the accommodation of over 700 children, at a cost of 31,000 $\frac{1}{2}$ l.

A NEW Unitarian church was opened at Northampton on the 7th inst.

A CHURCH bell has been cast at Zehlendorf, near Berlin, to the order of the Evangelical community at Paarl, Cape Colony. The bell is to commemorate the Queen's Jubilee.

HAWES INN, South Queensferry, made famous by Sir Walter Scott in "The Antiquary," was attacked by fire on Tuesday night. Owing to the efforts of the Edinburgh fire brigade the damage was confined to stores and outhouses.

THE Girls' County School at Bangor, having been rebuilt at an expenditure of 2,320 $\frac{1}{2}$ l. from the designs of Mr. J. R. Phillips, of Cardiff, were formally opened on Saturday, the 9th inst. They now provide accommodation for 100 girls and are thoroughly up-to-date in all particulars.

THE Carlisle City Council have adopted the scheme for obtaining a water-supply for the city from Geltsdale, to replace the Eden supply, which is condemned. The scheme will cost 120,000 $\frac{1}{2}$ l., and Parliamentary powers are to be sought during the ensuing session.

THE opening of new union offices at Leigh, Lancs., took place recently. The new buildings have been erected owing to the want of additional accommodation consequent upon the increase of members under the Local Government Act 1894, and a subsequent order of the Lancashire County Council. The cost of the extensions, which comprise spacious offices, board-room, tramp wards and laundry is about 12,000 $\frac{1}{2}$ l.

AT the last meeting of Linlithgow Town Council the provost read a letter from Mr. Ferguson, town clerk, stating that had he been present he would have intimated to the Council that it was his intention soon after the ensuing municipal election to resign the office of town clerk, which he had had the honour of holding for nearly thirteen years. His retirement was caused by the state of his health.

THE date of the formal opening of the new meat market and slaughter-houses in Bradford Street, Birmingham, has been definitely fixed for Wednesday, the 27th inst. The ceremony will be performed by the Lord Mayor, and in the evening the members of the City Council, the chief officials and representatives of the meat trade will be entertained to dinner at the Grand Hotel by Councillor Parkes, M.P., the chairman of the markets and fairs committee.

SMOKY CHIMNEYS

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot. The chimney which the "Empress" will not cure may be considered hopeless so far as any outside treatment goes. It must be reconstructed or the fireplace altered. At least 90 per cent. of smoky chimneys on which "Empress" is fixed are Cured.

FULL PARTICULARS OF SIZES, PRICES, &c., ON APPLICATION TO THE MAKERS—

EWART & SON,
346 Euston Road, London, N.W.

ESTABLISHED 60 YEARS.

Our Foreman in charge of this Department will attend appointments to examine chimneys and advise. For such attendance in London or suburbs no charge is made. For country appointments railway fares only charged.

At a meeting of the stewards of the freemen of Newcastle, at the close of the Michaelmas Guild, it was decided by a large majority to grant a site for the new infirmary which Mrs. Hall proposes to build on the Leazes. It was also resolved that the site should be an absolute gift as far as the freemen's interest in it is concerned. The freehold of the Leazes and other parts of the town moor belongs to the Corporation, but the freemen own pasturage rights which give them an effective share in the control or disposal of the land.

THE magistrate sitting at Southwark Police Court had before him a claim by a district surveyor against Patrick & Son, builders, for over 23/., charges for inspecting and superintending the erection of Jubilee stands. The complainant admitted that he saw nothing of the work except from the street, but still he said he was entitled to his fees. The defence was that the stands were not "structures" within the meaning of the Act, and that the surveyor was not entitled to do his work by deputy. The case was adjourned.

THE Lord Mayor of Sheffield (the Duke of Norfolk) on the 7th inst. formally opened a block of cottages which the Guardians of the Sheffield Union have had erected for the accommodation of aged poor. The homes are part of the Guardians' scheme for the classification of the recipients of relief, by which the deserving are treated better than the undeserving. They consist of an administrative block in the centre, which will be occupied by a man and his wife as officers, and four one-storey cottages with a single room on either side of this block. Each room is for the accommodation of either an aged married couple, two old men, or two old women.

WE understand that Messrs. Douglas Young & Co., of Coleman Street, have disposed of the historic manses and grounds known as Gildea Hall, Romford, which formed one of the assets of the late Liberator Building Society. This, together with Chingford and Tilbury, disposes of three out of five estates offered to auction in July last. The remaining estates at Clapham and Norbury are now under negotiation, and it is thought that further sales will be announced in a few days. The total realised for the three estates is 135,000/.

THE new bridge which has been erected at Talycafn, in the Vale of Conway, to replace the ancient ferry, and the construction of which has occupied nearly two years, was formally declared open on Saturday, the 9th inst. It is a substantial structure, which, if not very artistic, will prove an immense boon to foot and vehicular traffic. The length of the bridge

between the abutments is 353 feet. The centre span has a width of 150 feet, and a clear minimum headway of 18 feet at high water, while there is a span over the public road (Carnarvon side) of 20 feet; the total length of the three approved roads and the bridge is 1,370 feet. Messrs. Dawson & Fyson, Victoria Street, London, were the engineers, their resident representative being Mr. H. F. Richards.

EARLY on Monday morning it was discovered that the Rye Lane, Peckham, railway station of the London, Brighton and South Coast Railway Company had taken fire. Through a light being carelessly thrown down the up main line platform had caught fire, and over 30 yards of the platform were blazing when the firemen arrived. For a time the fire presented a very serious aspect, but the firemen scaled the roofs of the adjoining buildings, and poured such continuous streams of water on to the blazing mass that it became obvious, in the course of an hour, that the waiting-rooms and general offices of the Brighton Company, as well as those of the London, Chatham and Dover Company, which also runs into the Peckham Rye station, would be saved. About 100 feet of the main line up platform, however, was destroyed. The fire did not interfere with the ordinary traffic.

THE scheme which is about to be carried out for the water supply of Bedworth is the constant supply system, and the well that has been sunk by the parish will be utilised; the supply having been proved, after continuous testing, satisfactory, and the quality good, after careful analysis. A dry well of iron cylinders will be constructed adjacent to the present well, from which the supply will be drawn, and over this will be a water tower carrying a tank of 60,000 gallons capacity. This tank will be erected about 100 feet from the ground, and will give at all times adequate pressure over the town. The daily requirements of the population are estimated at 85,000 gallons. This allows 15 gallons per head for a population of 5,500; and the yield of the well has been found to be as much as 210,000 gallons in twenty-four hours.

THE foundation-stone of the free library to be presented to the town of Stalybridge by Mr. J. F. Cheetham at a cost of 6,000/., was laid on Saturday afternoon by Mrs. Astley-Cheetham. Mr. Medland Taylor, of Manchester, is the architect of the library, and Mr. H. Tanner has prepared the design for the post-office, a similar treatment for both buildings being adopted. The elevations show a handsome block of buildings, Jacobean in style, with big mullioned windows and bold cornices.

ARCHITECTURAL PHOTOGRAPHERS,
11 LUDGATE HILL.

PRICE LIST AND ESTIMATES ON APPLICATION.

The work will be carried out in stone, with some red brick introduced in the chimneys and in the plain wall surfaces. To Trinity Street there is a frontage for the two buildings of about 130 feet, two-thirds of which is occupied by the library. This façade is broken up by boldly projecting and gabled bays. There are upper floors to both library and post-office along Trinity Street front, that of the library being mainly occupied by a lecture-hall, which extends nearly the whole length of the building. The other principal rooms of the library are a large newsroom, a reference library, a lending library, and boys' and ladies' reading-rooms. A central hall gives access to all these rooms, which are ranged round it, divided off by glazed partitions. The reference library will be furnished and treated as a comfortable private reading-room. It has two large bays and an angle nook, in which there will be an open fireplace. Active building operations will probably be commenced early in the new year.

THE "Paris Charity Bazaar Fire and its Lessons" is the subject of the paper to be read by Mr. Edwin O. Sachs before the Architectural Association on Friday, October 22. The paper will deal not only with technical facts regarding the construction of the fatal building and include particulars of the fire, but will be fully illustrated by views of the structure taken before and after the conflagration, copies of the contractor's drawings and other details which Mr. Sachs has brought over from France. The policy of the architect in generally trying to oppose or avoid regulations governing buildings will be dealt with, and the policy of the architect in saving his clients a few pounds and thereby incurring a moral responsibility of much of the annual loss of life will also be treated of. Among those who have been invited by the Association to attend the meeting with a view of participating in the discussion of the subject are Mr. Thomas Blasbill, the architect to the London County Council; Mr. Roberts, of the London County Council theatres committee; Mr. William Archer, the critic, as representing the public; and several of the leading fire-brigade officers.

THE plans for the extension of the Middlesex Hospital for the development of the medical school provide for the pulling down of part of the buildings on the west face of the garden, but the museum will remain as a lecture theatre. The new block will contain two wings set at right angles, and facing respectively the hospital garden and Union Street. The latter site, with a frontage of some 80 feet, has been acquired for the purpose of the school extension. The new garden block will contain a complete chemical department, with laboratories and lecturers' room, while on the upper floor will be the pathological

department. The basement and ground floor of the new Union Street block will be occupied by the physical laboratory and a physiological department. The upper floor will be utilised for a dissecting-room and anatomical classroom. It is expected that the new buildings will be completed and ready for use early next year.

At the last monthly meeting of the Helensburgh Town Council, Provost Anderson referred to the fact of Mr. Maclachan having just completed his jubilee as clerk to the Board, and said it was only in deference to Mr. Maclachan's wishes that the event had not been marked by a tangible token of the appreciation in which he was held by the Council and the entire community. The Provost concluded by offering the warmest congratulations to Mr. Maclachan, and it was the heartfelt hope of all that he would be spared for many years to serve the Council. Ex-Provost Breingan said he did not think there was any town clerk in Scotland who had served under so many provosts without offending any one of them. Nobody was more delighted than he was to see Mr. Maclachan enjoying such good health. It was remitted to the Provost to prepare an appreciative minute in recognition of Mr. Maclachan's services.

THE Chiswick Urban District Council has shown a good example to other districts by the adoption of a steam dustcart. The carts, which have a capacity of six cubic yards, are built on the familiar tip-waggon model. They can carry a weight of four tons. The weight of a car unloaded is three tons. The cars are driven by steam. The engine can run up to 400 revolutions a minute, and can be thrown in and out of gear without shock by means of a special clutch. This is, of course, very convenient when constant stoppages have to be made. A run of five or six hours can be made without taking in water. During a working day of ten hours collecting dust and taking it to the tip, about two hundredweights of steam coal are consumed. On an average eighteen cubic yards of refuse are collected and tipped in the day. One man drives and steers. The Chiswick authorities estimate a saving of 250% a year on each steam waggon over the old system of collecting.

THE "University Hall for Women Students" at Bangor was recently opened by Miss Helen Gladstone. It is in the Queen Anne style, and consists of a basement and four storeys, the main block being flanked at either end by a wing placed at right angles. Through the building there runs a main corridor with staircases at either end. The principal rooms on the ground floor are the dining-hall, drawing-room, two common studies, housekeeper's room and offices, cloakrooms, dormitories,

ALL CARPETS MADE UP FREE OF CHARGE.

kitchens, &c. On the first floor are fine students' double study, bedrooms—six single, and cubicle accommodation for nine. On this floor also is the lady principal's suite of rooms, with heated linen-rooms; bathrooms, &c. The second floor is practically a replica of the first floor, except that here is provided an isolated sick-room, with hospital bath for use adjoining. In the attic are servants' quarters, with box and store-rooms. There is accommodation for fifty students. A feature in the internal arrangements is the faience fireplaces throughout, from the special designs of the architect, and made, together with all the brick and terra-cotta work, by Mr. J. C. Edwards, of Ruabon. The grounds contain two large tennis courts and a croquet green. The cost of the structural portion of the buildings is 5,000*l.*, an additional 200*l.* having been expended on the grounds.

THE ancient church of St. Alkmund, Shrewsbury, has been reopened after undergoing partial restoration, the object of which was to render the inside of the building more churchlike and dignified. The work just executed has been the removal of the west gallery (which on examination proved to be absolutely rotten and unsafe), the lowering and reconstruction of the seating to a more convenient form, putting concrete and solid wood-block floors under same in place of the old boarded floors which were found to be in a bad state of dry rot; the formation of a chancel by throwing out a projection in the nave, in which are placed oak stalls for the clergy and choir; and the erection of oak screens for forming vestries and organ-chamber. The organ, which formerly stood in the west gallery, is now placed in the chancel. The new chancel floor is paved with blue stone in squares, the sacarium with polished coloured marbles, and a beautiful oak-traceried pulpit is placed against the north screen. One of the nave windows has been filled in with stone tracery and cathedral glass, and it is proposed later to fill in the other windows in a similar manner, though with some variety in detail.
